An Annual Report from
The Lombardi Program on Measuring University Performance

December 2005
CORRECTED

NOTICE:

Due to a technical error in *TheCenter* database, the original published hardcopy version of *The Top American Research Universities*, 2005 had erroneous data in some of the tables. Specifically, the **Postdoctoral Appointees** table had incorrect control rankings (pages 106-113 in the original printed version). Because the Postdoctoral Appointees table was incorrect, the tables that displayed the **Top American Research Universities** (pages 28-39 in the original printed version), the two tables that displayed *TheCenter Measures* (pages 170-185 in the original printed version), and the table that displayed **The Top 200 Institutions—Postdoctoral Appointees (2003)** (pages 216-219 in the original printed version) were also incorrect.

We corrected the control rankings in the database and posted the corrected tables on *TheCenter* website (<http://thecenter.ufl.edu>). In addition, *TheCenter* has republished this corrected hardcopy 2005 edition of *The Top American Research Universities* to replace the original edition.

Introduction

Background

The task of building and sustaining an American research university challenges every member of the institution's extended community. Progress in this permanent quest requires enthusiasm, commitment, talent, and resources as well as reliable comparative data. The task for universities is to improve – measured not only by what they did last year or the year before but also in comparison to what their counterparts and competitors have accomplished. Reference points for comparative success serve the utilitarian purpose of measuring progress.

The Top American Research Universities annual report charts the comparative performance of institutions, reflecting our conviction that research university success comes from effectively investing in and managing individual institutions. American universities exist in many different bureaucratic arrangements, and public universities in particular often form parts of complex statewide system structures. Nonetheless, the key decisions about faculty and students that produce successful research universities occur primarily at the campus level. For that reason, this publication focuses on the performance of individual campuses, rather than systems, and adjusts the data to reflect the performance of each campus within a system.

The Top American Research Universities also presents a categorization of research universities into groups based on their performance on nine measures, as described in the introduction to the tables. Institutions in the top group rank among the top 25 on all nine of the measures; in the second group they rank in the top 25 on eight measures; and so on. We similarly categorize universities that rank among the top 26 to 50 on at least one of the nine measures. This method does not produce a single ranked list; instead, it reflects our observation that the difference separating these top universities is not sufficiently great to justify creating a single, rank-ordered list.

The very best universities compete at top levels on most everything they do. Others compete well on some measures but not as well on others. *TheCenter*-defined groups identify clusters of institutions with roughly comparable performance on a variety of measures.

This sixth edition continues the practice – begun with the report's second edition – of highlighting the national competition among universities in *The Top American Research Universities* tables, although we also include the tables for the Top Private and Top Public institutions separately, as in the previous reports. This focus on national rankings recognizes that the competition for high-quality faculty and students is primarily a single endeavor in which both public and private universities participate, regardless of their control or ownership. A university's private or public ownership (or control) influences some institutional characteristics that bear on its competitiveness within the national context, rather than creating independent competitive contexts.

In addition to the rankings tables, this edition of *The Top American Research Universities* continues the practice begun in the 2001 report of presenting data for all major research universities, defined by *TheCenter* as those having more than \$20 million in federal research expenditures. These tables include the nine indicators used to determine *The Top American Research Universities*, as well as a variety of institutional and trend data characteristics that may be of interest to many observers. The scope of these tables now includes non-federal research expenditures, total research expenditures by major discipline, and more trend data, and presents data on the top 200 institutions for each measure used in constructing the categories.

Each university, however, exists within a unique context and has different interests in these data. For this reason, *TheCenter* provides all of the data in this publication as well as additional tables of related information on its Web site [<http://thecenter.ufl.edu>] in two formats. This publication, in its entirety, appears as a PDF file, available for downloading and printing. All of the data tables presented in this report also appear on the Web site in Microsoft Excel format, suitable for downloading and further analysis. In addition, the Web-based tables include data and institutional characteristics for the approximately 600 universities and colleges with any federal research since 1990 (versus the more-than-\$20-million group presented here). *TheCenter* Web site provides a variety of other information, as well.

Medical and Engineering Programs

In the essay portion of this 2005 edition of *The Top American Research Universities*, we build on the continuing effort to understand the impact of major components of research university activities on the key determinants of competitive research success.

We have looked at a wide range of characteristics including the impact of medical schools, the significance of undergraduate student enrollment, the impact of ownership (private or public), the organizational structure of public universities within their systems, the importance of disposable income in supporting research competition, and the role of intercollegiate athletics in research universities.

“The role of high performing medical schools and competitive engineering schools appears to give a critical advantage in the university competition for research funding.”

medical schools vary dramatically in their research productivity, we thought it useful to place the contribution of medical schools to their campus’ research productivity into a clearer perspective. This edition includes a discussion of the impact of medical schools and engineering schools on research university competitiveness and provides a set of data that reorders the institutions with the medical school component removed. As is always our practice, we put the complete table used for this discussion on line in Excel format so our colleagues can download it and reorder or reanalyze it as appropriate for their needs.

In this year’s report, we return to a topic of considerable continuing interest in the management of research university competition. Most observers of this competition see the role of high performing medical schools and competitive engineering schools as critical advantages in the competition for federal and other research funding. They worry that the comparisons between institutions with medical and engineering schools and those without distort their relative competitiveness. While the data are very clear that

TheCenter at Six Years

A unique research enterprise, *TheCenter* focuses on the competitive national context for major research universities. As mentioned above, *TheCenter*’s annual report, *The Top American Research Universities*, classifies universities into groups according to their standing on nine measures: total research expenditures, federal research expenditures, endowment assets, annual giving, National Academy members, faculty awards, PhDs awarded, postdoctoral appointees, and SAT/ACT scores. *The Top American Research Universities* not only provides data on various research universities, but also addresses a topic relevant to university performance as part of each year’s publication. These studies, also published separately online, include:

- The Myth of Number One: Indicators of Research University Performance (2000)
- Quality Engines: The Competitive Context for Research Universities (2001)
- University Organization, Governance, and Competitiveness (2002)
- The Sports Imperative in America’s Research Universities (2003)
- Measuring and Improving Research Universities: *TheCenter* at Five Years (2004)
- Deconstructing University Rankings: Medicine and Engineering and Single Campus Research Competitiveness (2005)

The Top American Research Universities provides a set of data universities find useful for many purposes in measuring their competitive performance. Many universities routinely request multiple copies of the report each year to give to donors, trustees, and legislatures. The report provides a context for monitoring progress from year to year, and serves as a benchmark for institutional comparisons. Universities also use our report as a means to complete strategic plans. Various other groups contact *TheCenter* for copies of the report or for permission to reproduce the parts of the report of interest to their institution. Agencies and consulting firms request copies when taking on higher education clients, and graduate students from across the country use *TheCenter* Web site and call seeking additional data for their research.

TheCenter also appears as a reference on various Web sites. These include the Association for American Universities (AAU; <http://www.aau.edu>) and the Association for American Universities Data Exchange (AAUDE; <http://www.pb.illinois.edu/AAUDE/>). Another site is the University of Illinois' education library's excellent site that references a wide range of college rankings publications (<http://www.library.uiuc.edu/edx/rankgrad.htm>). Many institutions use *TheCenter's* faculty awards and honors list as a standardized source for these difficult-to-compile data.

Another feature of particular interest to institutions is the focus on campus-specific data within the tables of *The Top American Research Universities*. Many sources of university data report numbers for systems in some states and for individual campuses in others, making comparisons difficult. *TheCenter* allocates system data to individual campuses using the best information (usually from the campuses themselves) available. Indeed, it is this feature that prompted the Carnegie Foundation for the Advancement of Teaching to use *TheCenter's* methodology for allocating system data to campuses for its new classifications.

For R&D expenditures data, we used the allocation scheme developed by *TheCenter* at the University of Florida and used in their rankings of research universities (see <http://thecenter.ufl.edu/DataNotesIntroText.html> [accessed December 20, 2005]). The Carnegie Classification of Institutions of Higher Education (<http://carnegieclassification-preview.org/pdf/preview-basic2005.pdf>), accessed December 30, 2005.

The response includes an average of 6,300 hits within the four months immediately following its release each year. On average, *TheCenter* mails approximately 2,800 copies of the report each year, which includes foreign requests. Immediately following the release of the report, newspapers across the country call *TheCenter* to get more information regarding the results. National newspapers are often interested in the content of the new essay presented in the front section of the report each year.

In addition to the annual report and the separately published studies mentioned above, *TheCenter* also produces various other publications on issues important to research universities, such as national rankings and faculty data. Below is a comprehensive list of the publications produced by *TheCenter*.

- A series of columns (Reality Check), many on issues derived from *TheCenter's* work appears at Inside Higher Education, an online higher education publication. Available at [[\[insidehighered.com/views/reality_check\]\(http://insidehighered.com/views/reality_check\)\] some of the topics include:](http://

[<http://thecenter.ufl.edu/usnews.html>]

In addition to publications, the staff of *TheCenter* has been asked to present talks on the research at various conferences, both nationally and internationally. The staff has made presentations at national conferences such as the National Education Writers' Association, Collegis Conference, National Council of University Research Administrators, Association of Institutional Research, Association of American Universities Data Exchange, Southern Association of College and University Business Officers, New England Association for Institutional Research, and American Strategic Management Institute. International presentations have also been made in China and Venezuela. In addition, *TheCenter* and its co-directors receive many visitors from various countries and institutions including Japan, US Naval Postgraduate School, Toyota Technical Center, and the Mitsubishi Research Institute.

The Advisory Board, The Staff, and Institutional Support

In developing this sixth edition of *The Top American Research Universities*, we continued to benefit greatly from many suggestions from our colleagues, but special thanks go to the members of our Advisory Board, listed on the inside back cover. Their observations, suggestions, and critiques help us immeasurably.

The work reflected in this publication draws on the exceptional support of Lynne Collis, who manages *TheCenter's* administrative services. Without her expertise, dedication, and initiative, this publication would not have appeared. We appreciate the work of Craig Abbey at SUNY for his help with the study of medical and engineering programs.

This report draws on the work of Kristy Reeves as Research Director for the 2005 edition and the careful work of Craig Abbey, Research Director for this corrected edition. We have continued to rely on the expertise of Denise Mirka (University of Florida, Office of Institutional Research), and we are pleased to acknowledge Victor Yellen, Director of Institutional Research at Florida, for his constant support, encouragement, and expertise over the years.

Over the last several years, this publication, originally an effort of the University of Florida, has become a multi-university collaboration with support provided by the University of Florida; the University of Massachusetts Amherst; and SUNY, The State University of New York. This broad base of institutional support has made it possible for the co-directors to continue to sustain the *TheCenter's* work and to insist on the principle that university data, derived from national sources and institutional cooperation, must be presented to the academic community in an open, comprehensive, and freely accessible format.

That mission has inspired *The Top American Research Universities* project since it came into being through a significant gift from Mr. Lewis M. Schott. His commitment to this project and its authors is a source of inspiration and encouragement second to none.

John V. Lombardi

Elizabeth D. Capaldi

Deconstructing University Rankings

Medicine and Engineering, and Single Campus Research Competitiveness

Finding Number One

Major research universities continually monitor their performance relative to other highly competitive institutions, seeking to understand their own position within the competition for the faculty, students, and resources that produce institutional quality and, by extension, prestige. We have participated in this effort at *TheCenter* for a number of years, producing tables on research university performance that rely on the best nationally available data. Many other organizations, mostly commercial, make various comparisons that attempt to rank institutional performance, but most of these efforts are highly controversial and often of dubious methodological reliability. The most suspect comparisons attempt to assign a single number that represents university quality in some way and then rank all institutions by this single number. Even though the errors in this process are many and an extensive literature exists critiquing the process, single-value rankings remain popular for many reasons.

The principal virtue of these spurious rankings is that they purport to declare a “winner” in the competition for institutional quality in a format familiar to followers of college sports teams or the magazine rankings of corporations, hospitals, restaurants, movies, towns, and every other facet of American life. The rankings of colleges and universities offer the possibility for an annual, end-of-the-competitive-season score that heralds the season’s winner of the academic tournament. Although such notions become popular among various constituencies, the basic concept is foolish because university quality rarely changes dramatically from year to year, and the differences in the performance of similar institutions are not only too small to measure but essentially meaningless. As a result, institutions interested in understanding their relative position in the competition for quality look to other data such as the tables in *TheCenter’s Top American Research Universities (TARU)* to provide them with a context for assessing their own performance over time.

Measuring Market Share

All efforts to categorize academic institutions have limits defined by the characteristics of the data used and the methodology that constructs the tables. Intelligent use of any comparative university data requires an understanding of the purposes of the tables, and a clear sense of the questions the methodology and the categories derived from it can reliably answer. *TheCenter’s* data and methodology speak to a specific set of questions and provide answers within a specific context. Although we often make this point in various conversations, it bears repeating here. *TARU* does not attempt to measure something that might be called total university quality. It does not display the best undergraduate or graduate program. It does not find the highest-quality average faculty performance. These might well be useful outcomes, but the data currently available do not yield good answers to such questions, even though many commercial organizations attempt to provide answers using flawed data and unreliable methodology.

TARU asks a different set of questions. We have discussed this issue before, but the topic warrants continued attention. *TARU* is essentially a market share study. It begins with the observation that the pool of highly productive research talent is scarce relative to the number of higher education institutions competing for that talent. It continues with the observation that universities compete with each other to acquire as much of this talent as possible. *TARU* then looks at the national indicators that reflect institutional success in capturing shares of this scarce talent pool. As a result, in measuring federal research expenditures, for example, *TARU* reflects that portion of the total research dollars spent in any year attributable to the research work on each campus. This, in turn, is a reflection of the number of the campus’ high-quality research people and their effectiveness in the competition for grants from the fixed pool of federal research support.

While the data to measure market share of research talent do not exist in any reliable form, various indicators do exist. Because universities acquire this talent in order to increase their research productivity, the measurement of an indicator of success in the competition for research funding and other scarce research

products provides us with indicators of each institution's success in competing for talent. Choice of indicators is less the result of designing ideal markers of research productivity than it is a consequence of the national data collection that makes reasonably reliable information available about the nation's academic research productivity.

For that reason *TARU* focuses on total and federal research expenditures, two categories of faculty awards and distinctions, private resources related to endowment and annual giving, numbers of doctorates and post-docs, and, for an indicator of the institutional competitiveness in attracting high-quality students, average SAT scores. These nine indicators reflect much of the competitive focus of major research universities. The data do not capture every element of high-quality academic research competition. For example, the data on research success in the humanities and social sciences are only marginally captured in the data on faculty distinctions, and limited information exists on the quality of professional schools such as law, business, or nursing.

TARU also reflects another observation. Very good research universities often are very good in everything they do. Other institutions are nationally competitive in some things and not in others. As a result, *TARU* categorizes universities by how effectively they compete in all categories. In addition, because we think the real difference between similarly competitive institutions is quite small, we construct our categories broadly, taking institutions that fall into the top 25 in any category as being reasonably comparable in their competitiveness in acquiring market share of a particular resource in that category (research dollars, faculty awards, etc.). Even so, data have different uses in different contexts. While we have one perspective on these issues, others in the academic community

may find other methods of arranging these data more useful in pursuing their institutional goals. *TARU* provides all the data used in the categorization as well as additional information about institutional characteristics to the academic community each year on *TheCenter's* Web site [<http://thecenter.ufl.edu>]. This has two purposes. The first is to share the data with colleagues, and the second is to permit others to challenge, reconfigure, or replicate the work.

The Challenge of Comparability

Although this methodology and its data serve to distinguish the most competitive institutions and track the relative shares captured by institutions in this marketplace, *TARU* does not answer many other questions. For example, the success of any institution within this marketplace depends on a combination of many institutional characteristics. Some institutions have medical or engineering schools or colleges with significant emphasis on research fields of high significance to federal agencies with large amounts of available funding. Other institutions, with less emphasis on dollar-denominated science or with a relatively smaller commitment to fields of interest to federal research funding, for example, may end up with a smaller market share of federal expenditures, even though their faculty may be as distinguished and as productive as the science faculty of any institution.

Institutional size is relevant, as well, because all indicators speak to market share. The more faculty available to compete in the marketplace, all other things being equal, the higher the market share an institution can capture. University wealth is significant because the competition for talent requires money to hire highly talented individuals, to provide the research infrastructure, to support the institutional matching funds often required to compete for federal funding, to support the unrecovered costs of research activity, and to subsidize in many instances the time faculty spend on research rather than other revenue-generating activity such as teaching.

Previous editions of *TARU* have explored these topics as well as others, including the commitment of major research universities to high-cost and high-profile sports programs. These explorations have helped frame an understanding of the dynamics of institutional competition, and have contributed to an appreciation of the complexity of university research performance within a comparative context. If nothing else, the five previous editions of *TARU* have both confirmed the utility of the indicators provided and

“Top American Research Universities categorizes universities by how effectively they compete in all categories.”

highlighted the caution that must accompany broad comparative generalizations about institutional quality and competitiveness.

TARU includes a table (beginning with the 2003 edition) that displays the percent of federal research expenditures attributable to different disciplinary fields. These percentages offer an intriguing view into the wide differences in the distribution of research funding by discipline. These differences do not necessarily reflect a strategy related to research competition but rather may reflect institutional traditions, student profiles, state mission definitions, institutional scale, presence or absence of particular schools or colleges, and similar institutional characteristics that affect research competitiveness. Because research universities serve many constituencies, only one of which is concerned with research competitiveness, they rarely focus exclusively on research competition. The *TARU* and other studies that categorize institutions relative to their research performance speak only to that portion of the institution's mission associated with research.

The Magic of Medicine and Engineering

Among these compositional issues, it is common for university people to believe that the presence or absence of a medical school or an engineering college profoundly affects research competitiveness. This notion presumes that universities with medical schools have a significant competitive advantage because medical schools have a reputation for producing significant research funding. In an earlier *TARU* (2001) we looked at the question of whether having or not having a medical school distinguishes universities in terms of their research competitiveness. In that review, it became clear that the simple presence or absence of a medical school does not guarantee research success at high levels.

In this year's *TARU*, we look at the possibility of disaggregating the medical school component as well as the engineering component from the federal research expenditures reported in our data for those universities with more than \$20 million in federal research expenditures. The data for this exercise proved somewhat difficult to acquire, given the various ways in which universities report information to different agencies for different purposes. As is frequently the case for university data, reports provided to one agency or for one purpose do not necessarily match information collected for another agency or purpose,

even if the information appears to address the same universe. We have discussed elsewhere the extreme difficulty in identifying a number for faculty, even though common sense tells us it should be easy.

The Medicine and Engineering Data

In the current analysis, we have three sets of data of interest. The primary set comes from the National Science Foundation (NSF) and captures all federal research expenditures. The second set comes from the Association of American Medical Colleges (AAMC) and identifies medical school research expenditures defined in the same fashion as the NSF data.[†] The third set comes from the American Society for Engineering Education[‡] (ASEE) for engineering colleges, again using the same definitions as the NSF data, to capture engineering research expenditures. If we add up the engineering expenditures from ASEE and the medicine expenditures from AAMC for each institution, in some cases we have more expenditures than the institution reported to the NSF for all research fields. This usually means that the institution used slightly different definitions of what should be included in the various data reporting, which leads to some overlap. These inconsistencies in the data recommend caution in making too-fine distinctions among institutions because relatively small differences may well be data reporting artifacts and not reflections of actual differences in performance. For the broader issues related to understanding the general impact of

[†] The tables in the current study reflect the accreditation status of schools for the years reported. Florida State University (FSU) received initial accreditation for its medical school in 2005. However, the AAMC data provided to The Center showed FSU with \$511,000 in 2003 which amounted to 0.6% of their NSF total. Florida State University's AAMC reported federal research expenditures were subtracted when we removed medical from the institutions with accredited medical schools. This had no effect on their ranking when removing medicine only. When removing both medicine and engineering, FSU ranked 35th but would have ranked 34th had the \$511,000 not been removed. Rutgers which ranked 34th would then have ranked 35th.

[‡] Not all institutions with federal engineering research expenditures reported data to American Society for Engineering Education (ASEE). For example, the California Institute of Technology does not report data to ASEE although it is a member institution. However, Cal Tech reported to NSF that 16.9 percent of their \$219 million in federal research was in engineering. To take this into account, when an institution did not report to ASEE, their engineering dollars reported to NSF were used instead. For simplicity, the text and tables refer to institutions with and without ASEE Engineering Schools.

Figure 1. Federal Expenditures from AAMC Medical Schools (2003)

medical or engineering programs on campus research competitiveness, these data serve rather well.

This discussion takes a substantial subset of the institutions included in the *TARU* universe. As most readers of these reports know, *TARU* captures those single-campus institutions with federal research expenditures as reported by the NSF of at least \$20 million per year. For this analysis using the 2003 data, 187 institutions meet this criterion and capture about 94% of all federal research expenditures reported to the NSF. Within this group, for this discussion, we excluded single-campus institutions composed of a medical center without substantial non-medical programs or degrees. For example, the subset does not include the University of California San Francisco or the University of Texas MD Anderson Cancer Center but does include the University of California Los Angeles.

The remaining 149 single-campus institutions include 71 with medical schools, 132 with engineering schools, and only 6 (Boston College, Brandeis, Uni-

versity of Montana–Missoula, New York University, Indiana University Bloomington, and the University at Albany) are without either engineering or medicine. In 2003 this subset of institutions represented about 81.5% of all federal academic research and development expenditures.

A close look at the data demonstrates that while most of the top research performers do indeed have medical schools, many of the institutions with much more modest research performance also have medical schools. Consequently, the data appear to indicate that while a research-oriented medical school may well be an advantage, many medical schools appear to contribute relatively little to the total research productivity of the institution. As Figure 1 demonstrates, the amount of research contributed by the 71 AAMC medical schools to their campuses included in this study varies widely from \$336 million for The Johns Hopkins University to \$0.511 million for Florida State University.

Even though this answers the question of whether the acquisition of a medical school signals a clear path to highly competitive research performance (it does not), we also need to look at the comparable data for engineering schools. As noted, most research universities – 132 out of 149 in these data – have an engineering school. The range of contribution to the federally funded research total has a high point at Johns Hopkins with \$179 million to a low at the University of Oregon with \$0.025 million. Although engineering schools do not provide the same amount of research funding as medical schools, they nonetheless provide a significant contribution. The more useful observation, however, is to note that almost 90% of all these institutions have an engineering school and, as a result, engineering is not as likely to be as much of a differentiator among institutions as are medical schools that exist on just under half of the campuses (47.7%).

Impact on Rankings

To understand the impact of medicine and engineering schools on ranking, we constructed a list of the 149 institutions and included columns for federal expenditures reported by the NSF, research expenditures attributable to their medical schools (if they have one as part of the campus), and research expenditures attributable to their engineering schools (again, if they have one as part of the campus).

We then produced four different rankings – one based on the NSF total, one based on the NSF total less the medical school amount, one based on the NSF total less the engineering amount, and one based on the NSF total less both engineering and medicine amounts. In this exercise we looked at how much of the rank based on NSF research expenditures, an indicator widely reported, is attributable to the contribution of medical and engineering schools. We then considered the change in rank that would result from ordering institutions by their NSF research expenditures without the medicine or engineering contribution.

It's no surprise to close observers of these data that the relative position of institutions after subtracting the medical school portion changes substantially. However, changes in rank vary significantly. While some highly performing institutions with medical schools do indeed drop in rank, not all drop by the same amount. Similarly in the reordering, not all institutions without medical schools improve dramatically in rank when compared to their counterparts minus the medical school contributions.

A simple demonstration of this effect appears in the following tables. The first table shows the institutions ranked in the top 20 in terms of their total research expenditures. This list is familiar to all observers of American research university competition and contains no surprises (see Table 1, page 12).

If, however, we take out the amount of research reported by the medical schools to the AAMC from the NSF total for those institutions with medical schools, eight institutions no longer occupy places among the top 20 by research expenditures. Note in Table 2 (page 12) that change in rank varies substantially with some institutions, falling by as much as 50 or more places in the case of Yale, Duke, and Washington University–St. Louis while others fall by much smaller amounts such as the University of Southern California at only 7 places.

Another group of 12 institutions remain in the top 20 regardless of whether the AAMC data contribute to the research expenditures or not (see Table 3, page 13). The appendix includes tables with the AAMC research totals for all the institutions with medical schools. Note that among the institutions that stay in the top 20, even with medical schools removed from the NSF totals, nine of them have medical schools, but their research volume from other parts of the campus remain high enough to sustain a top 20 competitive position. MIT, Penn State, and Illinois–Urbana-Champaign, institutions that do not have medical schools on the main campus or at all (in the case of MIT), nonetheless had enough research from other departments and disciplines on campus to sustain top 20 rankings within a context that includes as well as excludes medical school research productivity. This result appears to indicate substantial institutional commitment to support nationally competitive research activity across a broad range of disciplines in addition to medically related research.

A final group of eight universities rise into the top 20 ranked without AAMC data included in the NSF research expenditures. Again, for some of these

“Many medical schools appear to contribute relatively little to the total research productivity of the institution.”

Table 1: Federal Research Expenditures Reported by the NSF (2003)

Institutions Ranked by Federal Research Expenditures, (2003)	(000)	Ranking
Johns Hopkins University	1,106,971	1

University of Minnesota - Twin Cities	293,266	17
University of North Carolina - Chapel Hill	280,678	18
Pennsylvania State University - University Park	270,985	19
University of Illinois - Urbana-Champaign	266,487	20

Table 2: Institutions Out of the Top 20 with AAMC Medical Expenditures Removed (2003)

Institutions OUT OF TOP 20 without Medical School	NSF Total (\$000)	NSF Rank	Change in Rank NSF less AAMC Exp.
University of California - Los Angeles	421,174	5	23
University of Pennsylvania	415,631	6	48
Washington University in St. Louis	357,364	10	65
University of Pittsburgh - Pittsburgh	345,625	13	30
Duke University	306,864	14	58
University of Southern California	300,195	15	22
Yale University	296,713	16	73
University of North Carolina - Chapel Hill	280,678	18	34

institutions the change in rank is significant, moving up at least 20 places in the case of the University of Colorado–Boulder and the University of Maryland–College Park (see Table 4, page 13). This may well indicate that on these campuses the medical school has less research volume relative to the other disciplines and programs that compete for funding from federal sources.

Before turning to a variety of ways to review these results, we should add the engineering component to this discussion. If we take the same group of 149 institutions and subtract out the engineering research as reported to the ASEE, we get a somewhat different effect. Note in Table 5 (see page 15) that of the top

20 institutions using total NSF expenditures, four rise into the top 20 and four fall out of the top 20 without the ASEE engineering data included.

Some Observations on Institutional Profiles

The focus on campuses excluding medicine reflects an academic commitment to the notion of the well-rounded university – the campus that cultivates the liberal arts and sciences as the core activity of a mainstream university. While not denying in any way the benefits from high degrees of specialization that

occur in many medical centers, an institution with substantial amounts of its work focused on medical center activities may have less of an engagement with undergraduate education, less involvement in Master's and Ph.D. education, and less engagement with other fields such as business or education. Of course, different institutions and their constituencies can value these concentrations differently depending on history and mission. But for those who seek an understanding of the core, non-medical-center activities of today's research universities, this conversation holds considerable interest.

Many possible explanations fit these data. The simplest is that research-oriented medical schools,

with their strong commitment to basic and clinical research, generally must have effective systems for generating surplus revenue from patient charges, reimbursements, endowments, hospital subsidies, and other sources to support the highly competitive research enterprises required to successfully compete for federal research dollars. Compounding these advantages, the federal research establishment has seen large increases in the pool of funds available for a wide range of life sciences and clinically related research, further enhancing the opportunities for medical school research enterprises. Indeed, within the group of 149 campuses included here, the AAMC medical expenditures come to just under 36% of the NSF-reported federal research expenditures. Clearly, the distribution of fed-

eral dollars related to medical research substantially affects the overall research ranking of these institutions. In our previous work, we found a strong relationship between an indicator of the discretionary revenue an institution can generate (over and above what it costs to provide baseline instruction to undergraduates) and research success. When a medical enterprise has a substantial research focus, most likely the mechanisms for generating surplus revenue from various medical and hospital activities provide the essential subsidies required for successful research competition. Institutions with no medical enterprise on campus or those whose medical school does not generate substantial surpluses for investment in research show less success in their overall total NSF research funding.

“When medicine and engineering disappear from the totals of the highly competitive institutions, previously less-competitive institutions improve their score.”

Medical schools, by virtue of their revenue model, have the opportunity to structure their business affairs to subsidize the basic sciences that compete for NIH and other life sciences funding and, in addition, subsidize clinical research conducted by the clinical faculty. Where medical schools have strong relationships with prosperous teaching hospitals, those hospitals often subsidize research costs

because the hospital’s competitiveness as a tertiary care medical facility depends in considerable measure on its affiliated medical school’s reputation for research achievement.

This scenario, though familiar to those who work closely with complex university medical establishments, leaves considerable room for additional explanation. In some institutions with strong research medical schools, life sciences research, by design, may become concentrated in the medical school, and life sciences research in traditional arts and sciences departments may receive significantly less institutional support. An institution with this model, we could hypothesize, might well show a dramatic change in its research ranking with the medical school removed. Another institution, which encourages and supports life sciences research both in the medical school and

in the traditional arts and sciences departments or perhaps in the life sciences related units of a significant land grant college, may see its rank fall some with the medical school removed but perhaps not by as much.

Similarly, if an institution does not have a medical school, it will by necessity concentrate its support of life sciences research in the arts and sciences departments, in land grant units, and in many cases in life sciences related engineering programs. Such institutions would rank lower in competition with campuses that include research-oriented medical schools because they would not enjoy the strong subsidies available to medical colleges. But with the medical school component removed from their competitors’ totals, these institutions would rise in the rankings.

While these hypotheses surely have explanatory merit, experience with these data tells us that large-scale generalizations may well prove fragile. Institutions have widely varying financial and organizational models, different missions, varied ownership characteristics between public and private boards, complex arrangements between campuses and their affiliated medical enterprises, and different opportunities for subsidies from state public funds or corporate collaborations. These characteristics influence the success of an institution in achieving large market shares of federal research dollars.

Even so, it is probably reasonable to observe that institutions with a broad and comprehensive focus on research competitiveness, a clear sense of pursuing those parts of the research marketplace with the fastest growth rates, and a financial model that supports investment in research projects, facilities, support systems, and the like, will succeed with or without a medical school.

In addition, it is also reasonably clear that medical schools as an academic specialization do not necessarily provide the financial and institutional support required for successful research competition. When they do, they can be a major research asset. But not all of them provide significant contributions to the research productivity of individual campuses.

Another way of illustrating the variety of changes in rank among research campuses that occur with medicine and engineering research contributions removed appears in Figure 2 (see page 17). The trend line displays the rank order by total NSF research expenditures of all 149 research campuses included in this discussion. For each university campus the graph plots two additional points on a drop line to the full

* Campuses without ASEE engineering school.

NSF rank: the rank with medicine removed and the rank with engineering removed. Simple inspection of this display suggests some observations that are familiar to those who have followed our conversation on the subject of university rankings over the years.

As Figure 2 illustrates, at the high end of the total NSF research rankings, removing the medicine and engineering contributions to research expenditures drops the ranking considerably, reflecting the importance of medicine, in particular, in driving the research performance of these top institutions. Institutions in the lower half of the distribution by total NSF expenditures tend to improve their position with medicine and engineering removed. This reflects the relatively smaller part of these institutions' total NSF dollars contributed by medicine and engineering. When medicine and engineering disappear from the totals of the highly competitive institutions, previously less-competitive institutions improve their score.

While the rankings analysis helps us understand the components that influence rankings, and urge

caution in placing too much confidence in the meaning of relatively small changes in relative rank, the percentage of an institution's total research that comes from the medical school as reported in AAMC data offers another perspective on the dramatic variation in the importance of a medical school to individual campuses.

Of the 149 campuses in our data set, 71 have medical schools, and the medical school contribution to the campus total research expenditure of those 71 institutions ranges from a high of 100% to a low under 1%. Figure 3 (see page 18) illustrates the relationship between medicine's percentage of an institution's total federal research expenditures and the change in rank that occurs when we remove those medicine expenditures from the total. Not surprisingly, when medical research is a large percentage of a campus' research enterprise, it loses position relative to those universities without medical schools or whose medical schools do not produce much federal research.

In the case of engineering, as Figure 4 (see page 18) illustrates, the pattern is similar to the one for medicine but not as pronounced. Almost all of the institutions included here have an engineering school, and engineering expenditures represent only just over 17% of all federal research expenditures on average. The majority of institutions appear to cluster at the lower end of this distribution.

Deconstructing the Research University and the Search for Number One

This demonstration highlights a number of characteristics of university research competition. The most obvious is that highly competitive research-oriented medical schools contribute substantially to the success of many American research campuses. At the same time, simple formulations about the impact of medical institutions on academic research campuses likely will not help. Instead, we need a careful examination of the characteristics of the individual campuses before knowing how a medical enterprise – or the absence of a medical enterprise – affects the institution's competitiveness in gaining a significant market share of federal research. Some institutions – notably MIT – have been exceptionally effective at pursuing federal funding. Others, whose medical schools do not pursue research effectively, may experience no significant research benefit.

We also need to recognize that specific conclusions about the performance of research universities within the context of medical research create a struggle with a variety of data artifacts and anomalies in the reporting of information to the NSF and AAMC. Equally significant, some universities share the faculty engagement with the research enterprise with hospitals and other research institutions, and the success of these faculty appears in the totals reported for the non-university medical institution. Other campuses may operate the clinical research establishment of an affiliated hospital through the university's research system, adding the hospital-based research to the academic campus totals.

All of these circumstances challenge those who would make clear and unambiguous statements about the nature, effectiveness, quality, and quantity of the research performance of similar campuses. When the differences among campuses appear large, we may be on firmer ground in drawing some conclusions. But when the differences appear relatively small, and change from year to year, we should exercise great caution in presuming to know the difference between number 10 and number 15 in some ranking.

Although we have worked with the classification of research universities for some time, our recognition of the challenges remains as strong as ever. We know that, used carefully and effectively, the six years of data and discussion of *TARU* can help campuses better understand their competitive contexts and improve their performance. At the same time, we remain convinced that the search for the “Single Best American Research University” is mostly a waste of time and effort.

Part I

The Top American Research Universities

TheCenter determines the Top American Research Universities by their rank on nine different measures: Total Research, Federal Research, Endowment Assets, Annual Giving, National Academy Members, Faculty Awards, Doctorates Granted, Postdoctoral Appointees, and SAT/ACT range. (The Source Notes section of this study provides detailed information on each of the nine indicators.) The tables group research institutions according to how many times they rank in the top 25 on each of these nine measures. The top category includes those universities that rank in the top 25 on all nine indicators. The bottom category includes universities with only one of the nine measures ranked in the top 25. Within these groups, institutions are then sorted by how many times they rank between 26 and 50 on the nine performance variables, with ties listed alphabetically. A similar methodology produces a second set of institutions — those ranked 26 through 50 on the same nine measures.

For the purpose of this study, *TheCenter* includes only those institutions that had at least \$20 million in federal research expenditures in fiscal year 2003. This is the same dollar cutoff used in our last five reports.

The first two tables list each institution with the most current data available for each measure and its corresponding national rank (i.e., rank among all institutions regardless of whether they are privately or publicly controlled). The third and fourth tables provide the same nine data measures but with the groupings determined by the control rank (i.e., rank among all private or all public institutions). Institutions ranking in the top 25 on at least one measure are included in the tables with the (1-25) identifier, while those ranking 26 through 50 are found in the tables labeled with the (26-50) header.

- **The Top American Research Universities (1-25)** identifies the 51 institutions (25 private, 26 public) that rank in the top 25 nationally on at least one of the nine measures.

- **The Top American Research Universities (26-50)** identifies the 37 institutions (11 private, 26 public) that rank 26 through 50 nationally on at least one of the nine measures.

- **The Top Private Research Universities (1-25)** identifies the 36 private institutions that rank in the top 25 among all private universities on at least one of the nine measures.

- **The Top Public Research Universities (1-25)** identifies the 48 public institutions that rank in the top 25 among all public universities on at least one of the nine measures.

- **The Top Private and Public Research Universities (26-50)** identifies the 19 private and 38 public institutions that rank 26 through 50 among their private or public counterparts on at least one of the nine measures.

Many research universities rank highly both nationally and among their public or private peers, and therefore appear in more than one table. For example, of the 36 private institutions in the Top Private Research Universities (1-25) table, 25 universities also appear in the Top American Research Universities (1-25) table.

Data found in these tables may not always match the figures published by the original source. *TheCenter* makes adjustments, when necessary, to ensure that the data reflect the activity at a single campus rather than that of a multiple-campus institution or state university system. When data are missing from the original source, *TheCenter* may substitute another figure, if available. A full discussion of this subject, and the various adjustments or substitutions made to the original data, is in the Data Notes section of this report.

TheCenter presents these tables, along with prior years' top universities, in Microsoft Excel spreadsheets on its Web site <http://thecenter.ufl.edu>.

Part II

TheCenter Research Universities

TheCenter's Research Universities consist of academic institutions that had more than \$20 million in federal research expenditures in fiscal year 2003. In the following tables, institutions are listed alphabetically with the most current data available on each measure and their rank on each measure for each year. *TheCenter* provides both the national rank (rank among all universities) and the control rank (rank within private or public universities). We include five years of data for each measure. In addition to the nine performance variables presented in Part I tables, these tables also include other institutional characteristics related to student enrollment, medical schools, land grant status, ownership, research focus, and National Merit and National Achievement Scholars. The Source Notes section of this report provides detailed information on each data element. Tables in this section include the following:

- **Total Research Expenditures** (1999-2003)
- **Federal Research Expenditures** (1999-2003)
- **Research by Major Discipline** (2003)
- **Endowment Assets** (2000-2004)
- **Annual Giving** (2000-2004)
- **National Academy Membership** (2000-2004)
- **Faculty Awards** (2000-2004)
- **Doctorates Awarded** (2000-2004)
- **Postdoctoral Appointees** (1999-2003)
- **SAT Scores** (1999-2003)
Source: The Annual Survey of Colleges of the College Board and Data Base, 2004-2005. Copyright © 2004 College Entrance Examination Board. All rights reserved.
- **National Merit and Achievement Scholars** (2000-2004)

- **Change: Research** presents trend data on total, federal, and non-federal research (1994 and 2003) in constant dollars.
- **Change: Private Support and Doctorates** provides trend data on endowment assets (1995 and 2004) and annual giving (1995 and 2004) in constant dollars, and doctorates awarded (1995 and 2004).
- **Change: Students** includes trend data on SAT/ACT ranges (1995 and 2003), National Merit and Achievement Scholars (1995 and 2004), and student headcount enrollment (1994 and 2003).
- **Institutional Characteristics** includes state location, highest degree offered, medical school and land grant status, federal research focus (summary of federal research by discipline), and total student enrollment.
- **Student Characteristics** provides headcount enrollment data broken out by level (i.e., undergraduate, graduate, first-professional), part-time enrollment by level, and degrees awarded.
- **TheCenter Measures** presents the number of times a university ranks in the top 25 (or 26-50) on the nine quality measures in this year's report as compared to the past five year's (2000-2004) reports.

Data found in these tables may not always match the figures published by the original source. *TheCenter* makes adjustments, when necessary, to ensure that the data reflect the activity at a single campus rather than that of a multiple-campus institution or state university system. When data are missing from the original source, *TheCenter* may substitute another figure, if available. A full discussion of this subject, and the various adjustments or substitutions made to the original data, are in the Data Notes section of this report.

The prior years' data or ranks may differ slightly from our last report due to revised figures or estimates from the data source or institution.

TheCenter's Web site [<http://thecenter.ufl.edu>] provides these same tables in Microsoft Excel spreadsheets for ease of analysis. In addition to the over-\$20-million group, the on-line tables contain data on all institutions reporting any federal research since 1990.

Part III

The Top 200 Institutions

The following tables list the top 200 universities and colleges on each of the nine performance measures, along with National Merit and Achievement Scholars. (The Source Notes section provides detailed information on each of the 10 data elements.) Unlike the previous tables in Parts I and II, this section includes data for all academic institutions regardless of their federal research activity level.

TheCenter provides each institution's rank nationally among all universities as well as its rank by institutional control (i.e., rank among private or public peers). In cases where several institutions tie for last place, we use a different cutoff point. For National Academy members, we list all institutions with at least one National Academy member among their faculty (a total of 195 institutions). In the case of faculty awards, we limit institutions to those with at least three faculty awards (a total of 202 institutions). Tables in this section include:

- **2003 Total Research Expenditures**
- **2003 Federal Research Expenditures**
- **2004 Endowment Assets**
- **2004 Annual Giving**
- **2004 National Academy Membership**

- **2004 Faculty Awards**
- **2004 Doctorates Granted**
- **2003 Postdoctoral Appointees**
- **2003 SAT Scores**

(Source: the Annual Survey of Colleges of the College Board and Data Base, 2003-2004. Copyright © 2004 College Entrance Examination Board. All rights reserved.)

- **2004 National Merit and Achievement Scholars**

Data found in these tables may not always match the figures published by the original source. *TheCenter* makes adjustments, when necessary, to ensure that the data reflect the activity at a single campus rather than that of a multiple-campus institution or state university system. When data are missing from the original source, *TheCenter* may substitute another figure if available. A full discussion of this subject, as well as the various adjustments or substitutions made to the original data, is in the Data Notes section of this report.

TheCenter presents these tables, along with the prior years' top 200, as Microsoft Excel spreadsheets on-line at [<http://thecenter.ufl.edu>].

The Top 200 Institutions - Total Research Expenditures (2003)

Source Notes

The Center Measures

Total Research Expenditures Federal Research Expenditures

Source: NSF/SRS Survey of R&D Expenditures at Universities and Colleges, FY 2003.

Each year, the National Science Foundation (NSF) collects data from hundreds of academic institutions on expenditures for research and development in science and engineering fields and classifies them by source of funds (e.g., federal government, state and local government, industry, etc.). These data are the primary source of information on academic research and development (R&D) expenditures in the United States. Included in this survey are all activities specifically organized to produce research outcomes that are separately budgeted and accounted for. This “organized research” may be funded by an external agency or organization (“sponsored research”) or by a separately budgeted organizational unit within the institution (“university research”). This report excludes activities sponsored by external agencies that involve instruction, training (except training in research techniques, which is considered organized research), and health service, community service, or extension service projects.

All Federally Funded Research Labs (FFRLs) are excluded from these academic expenditures data, including the following: Jet Propulsion Laboratory (California Institute of Technology); Los Alamos National Lab, Lawrence Livermore Lab, Lawrence Berkeley Lab (University of California); Software Engineering Institute (Carnegie Mellon); Argonne National Laboratory (University of Chicago); National Astronomy and Ionospheric Center (Cornell); Ames Laboratory (Iowa State University); Lincoln Laboratory (MIT); Plasma Physics Lab (Princeton); and Linear Accelerator Center (Stanford). The NSF data no longer classify the Applied Physics Lab (APL) at Johns Hopkins as an FFRL, but federal funds support the vast majority of research conducted there. The APL makes up nearly one-half of Johns Hopkins’ total R&D expenditures and 53 percent of its federal R&D expenditures.

While inconsistencies in reporting (known and unknown) do exist here, as in any survey of this type, problems arise mostly when one breaks out the data by source of funds. NSF expects institutions to use

year-end accounting records to complete this report, and there are nationally recognized accounting guidelines for higher education institutions. However, there are also countless variations in institutional policy that determine whether the university reports a particular expenditure as coming from one source or another, or possibly not counted at all. Take federal formula funds for agriculture (e.g., Hatch-McIntire, Smith-Lever) as an example. We conducted an informal survey of the appropriate institutions in the Association of American Universities (AAU) and found that two out of eleven land grants did not include any of these federal funds in their 1997 NSF data, while others included all or some of these monies. Because these funds make up a very small percentage of the total research expenditures in any given year, the impact on our total research rankings is slight. The agriculture formula funds will have a somewhat greater, but still small, impact on the federal research rankings. NSF notes, “An increasing number of institutions have linkages with industry and foundations via subcontracts, thus complicating the identification of funding source. In addition, institutional policy may determine whether unrestricted state support is reported as state or as institutional funds.”¹

We believe that the reporting inconsistencies in the data are relatively minor when using the total research expenditures and the federal research expenditures component. Federal and state government audits of institutional accounting make deceptive practices highly unlikely, even though these entities do not audit the NSF data directly. NSF goes to great lengths to verify the accuracy of the data, especially federal expenditure data—checking them against several other federal agencies that collect the same or similar information. In fact, all major federal agencies and their subdivisions submit data to NSF identifying research obligations to universities each year. Historically, the NSF data have tracked very closely the data reported by universities.² Further, for their National Patterns of R&D Resources series, NSF prefers to use the figures reported by the performers of the work (that is, academic institutions, industry, nonprofits) because they believe that the performers are in the best position to accurately report these expenditures.

1. Academic R&D Expenditures, FY 2000: Technical Notes (On-line: <http://www.nsf.gov/sbe/srs/nsf02308/secta.htm>)
2. National Patterns of R&D Resources, 1998: Technical Notes (On-line: <http://www.nsf.gov/sbe/srs/nsf99335/appa.htm>)

In some sections of this report, these expenditure data are deflated to constant 1983 dollars to show real change over time. While NSF uses the Gross Domestic Price (GDP) implicit price deflator in its reports on federal trends in research, we use the Higher Education Price Index (HEPI) because of its narrower focus. Developed by Research Associates of Washington, the HEPI illustrates the effect of inflation on college and university operations.³ In contrast, the GDP implicit price deflator is based on change in the entire U.S. economy and, as noted by NSF itself, “[its] use more accurately reflects an ‘opportunity cost’ criterion [i.e., the value of R&D in terms of the amount of other goods and services that could have been spent with the same amount of money], rather than a measure of cost changes of doing research.”⁴

The research trend data always reflect the most recent published data available because NSF allows institutions to submit revised figures for up to two years. Each year, NSF reports data for the current year as well as for the previous seven years. Specifically, we use the 2003 Survey data for fiscal years (FYs) 2001-02, the 2002 Survey for FYs 1995-2000 data, and the 2001 Survey for FY 1994 data. NSF’s published nationwide totals for academic R&D expenditures will not always match the corresponding totals in this study due to NSF’s sampling procedures for smaller or non-reporting institutions. In some years, rather than identifying the institutions individually, NSF provides one aggregate figure for all sampled institutions.

Endowment Assets

Source: NACUBO Endowment Study as reported in the *Chronicle of Higher Education*, endowment market value as of June 30, 2004.

Institutions report the market value of their endowment assets as of June 30 to three different sources, and they quite often use three different values. For this project, we use the National Association of College and University Business Officers (NACUBO) Endowment Study because of NACUBO’s long history of reporting endowments of higher education institutions, their emphasis on using audited financial

statements, and their focus on net assets (i.e., includes returns on investments and excludes investment fees and other withdrawals). NACUBO conducts its study annually and reports the results each February in the *Chronicle of Higher Education*.

Another source for endowment assets is the Council for Aid to Education’s (CAE) annual Voluntary Support of Education (VSE) survey, cosponsored by the Council for Advancement and Support of Education (CASE) and the National Association of Independent Schools. The VSE survey is useful as a secondary resource because it provides more single-campus data than the other two sources. For those institutions that report a system-wide total to NACUBO, we often use the VSE data to calculate a campus’ percentage contribution to the entire system, applying that factor to the NACUBO figure. In other cases, we may substitute the VSE figure when the institution indicates that this is a good data source.

The National Center for Education Statistics (NCES) Integrated Postsecondary Education Data System (IPEDS) Finance Survey also collects information on endowment assets, but these figures are often much lower than the two other sources and also are available much later. Although IPEDS instructions say to report endowment assets for “the institution and any of its foundations or affiliated organizations,” it appears that not all institutions do so.

The fact that the NACUBO study requests net assets, while IPEDS and the VSE survey request gross assets, cannot explain the large differences found in some cases. In calling various institutions, we found it very difficult to determine exactly why the numbers vary so greatly. Oftentimes, two or more individuals at an institution independently report figures for these three reports with no clear understanding of how or why the numbers differ. An examination of the 1997 endowment figures provided by these institutions showed only one university (University of North Carolina at Chapel Hill) that submitted the same figure to each of the three organizations. We discovered no consistent pattern to explain reporting variations among the institutions. This area definitely warrants more study.

3. College and University Higher Education Price Index, 2005 Update, Research Associates of Washington, Washington, DC.

Annual Giving

Source: Council for Aid to Education's Voluntary Support of Education (VSE) Survey, FY 2004.

The Council for Aid to Education (CAE), an independent subsidiary of RAND, has produced the Voluntary Support of Education (VSE) Survey since 1986. The annual giving data include all contributions actually received during the institution's fiscal year in the form of cash, securities, company products, and other property from alumni, non-alumni individuals, corporations, foundations, religious organizations, and other groups. Not included in the totals are public funds, earnings on investments held by the institution, and unfulfilled pledges.

CAE's VSE Data Miner service, available on-line, provides 10 years of data for all participating institutions (more than 1,600 universities and colleges). Although this is a subscription-based service and requires a user ID and password, limited access is available on-line at [<http://www.cae.org/vse>].

National Academy Members

Source: National Academy of Sciences, National Academy of Engineering, and Institute of Medicine membership directories for 2004.

One of the highest honors that academic faculty can receive is membership in the National Academy of Sciences (NAS), the National Academy of Engineering (NAE), or the Institute of Medicine (IOM). All three are private, nonprofit organizations and serve as advisors to the federal government on science, technology, and medicine. Nominated and voted on by active members, newly elected members of these organizations receive life terms. Individuals elected to membership come from all sectors—academia, industry, government, and not-for-profit agencies or organizations. Member election dates are in February (NAE), April (NAS), and October (IOM).

The data collected for these rankings use active or emeritus members at their affiliated work institution, as reported in the on-line membership directories. In all cases, we were able to determine the specific campus for individual members. We re-check institutional affiliation annually to account for established members who have changed employers or whose membership is no longer active.

Faculty Awards in the Arts, Humanities, Science, Engineering, and Health

Source: Directories or Web-based listings for multiple agencies or organizations.

For this category, we collect data from several prominent grant and fellowship programs in the arts, humanities, science, engineering, and health fields. Included in this measure are:

- American Council of Learned Societies (ACLS) Fellows, 2003-04
- Beckman Young Investigators, 2004
- Burroughs Wellcome Fund Career Awards, 2004
- Cottrell Scholars, 2004
- Fulbright American Scholars, 2004-05
- Getty Scholars in Residence, 2004-05
- Guggenheim Fellows, 2004
- Howard Hughes Medical Institute Investigators, 2004
- Lasker Medical Research Awards, 2004
- MacArthur Foundation Fellows, 2004
- Andrew W. Mellon Foundation Distinguished Achievement Awards, 2004
- National Endowment for the Humanities (NEH) Fellows, 2005
- National Humanities Center Fellows, 2004-05
- National Institutes of Health (NIH) MERIT (R37) FY 2004
- National Medal of Science and National Medal of Technology, 2003
- NSF CAREER awards (excluding those who are also PECASE winners), 2004
- Newberry Library Long-term Fellows, 2004-05
- Pew Scholars in Biomedicine, 2004
- Presidential Early Career Awards for Scientists and Engineers (PECASE), 2004

- Robert Wood Johnson Policy Fellows, 2004-05
- Searle Scholars, 2004
- Sloan Research Fellows, 2004
- US Secretary of Agriculture Honor Awards, 2004
- Woodrow Wilson Fellows, 2004-05

While the vast majority of these programs clearly identify a particular campus, in a few instances we used the institution's web-based phone directory to determine the correct campus.

Doctorates Awarded

Source: NCES IPEDS Completions Survey, doctoral degrees awarded between July 1, 2003, and June 30, 2004.

Each year, universities report their degrees awarded to the NCES in the IPEDS Completions Survey. IPEDS provides straightforward instructions for reporting doctoral degrees awarded, and we do not find any inconsistencies in reporting among the universities included in our rankings. IPEDS asks each institution to identify the number of Doctor of Education, Doctor of Juridical Science, Doctor of Public Health, and Doctor of Philosophy degrees awarded between July 1 and June 30.

Most institutions in our study submit degree data by campus or offer doctoral degrees solely or primarily at the main campus.

In addition to doctorate degrees, *TheCenter* presents degrees awarded at other levels—associate's, bachelor's, master's, and professional degrees—in the Student Characteristics table (see Data Tables, pp. 162).

Postdoctoral Appointees

Source: NSF/Division of Science Resource Statistics (SRS) Survey of Graduate Students and Postdoctorates in Science and Engineering, Fall 2003.

Each year, NSF and NIH collect data from all institutions offering graduate programs in any science, engineering, or health field. The Survey of Graduate Students and Postdoctorates in Science and Engineering (also called the Graduate Student Survey or GSS) reflects graduate enrollment and postdoctoral employment at the beginning of the academic year. Postdoctorates are defined in the GSS as “individuals

with science and engineering PhD's, MD's, DDS's or DVM's and foreign degrees equivalent to U.S. doctorates who devote their primary effort to their own research training through research activities or study in the department under temporary appointments carrying no academic rank.” The definition excludes clinical fellows and those in medical residency training programs unless the primary purpose of their appointment is for research training under a senior mentor.

In the methodological notes for this survey,⁵ NSF indicates that it verifies the data with the institutional coordinator when dramatic year-to-year fluctuations are noted. In addition, in this data set, it is unclear whether an institution has actually reported zero postdocs or NSF has simply assigned a zero for non-response (rather than imputing by using prior-year or peer data, as described in NSF methodological notes). This year, in cases where we suspect it is not a true zero, we left the field blank.

Although each doctorate-granting campus submits data separately, NSF often aggregates them in its published reports. In all cases, we obtain the single-campus data for these schools directly from NSF.

SAT Scores

Source: The Annual Survey of Colleges of the College Board and Data Base, 2004-2005. Copyright © 2004 College Entrance Examination Board. All rights reserved.

The College Board reports the 25th and 75th percentiles for verbal and quantitative SAT I scores for most institutions in our study. The institutions submit these data to The College Board each spring through its Annual Survey of Colleges. For our measure, we calculated the median of that range. Some institutions report the ACT instead of the SAT to The College Board. In those cases, we use a conversion table provided by The College Board to generate a comparable SAT equivalent score.⁶ When an institution submits neither an SAT nor ACT score, we substitute data from the prior year reported.

5. Survey Methodology: Survey of Graduate Students and Postdoctorates in Science and Engineering (Online: <http://www.nsf.gov/statistics/srvygradpostdoc/>)
6. Concordance Between SAT I and ACT Scores for Individual Students, Research Notes 07, June 1999 (Online: http://www.collegeboard.org/research/html/rn_indx.html)

Other Measures of Undergraduate Quality

National Merit and Achievement Scholars

Source: The 2003-04 National Merit Scholarship Corporation Annual Report, which reflects the 2004 freshman class.

The National Merit Scholarship Corporation (NMSC) is an independent, nonprofit organization that awards scholarships to the nation's outstanding high school seniors based on their academic achievement, qualifying test scores, high school principal and counselor recommendations, and their activities, interests, and goals. The NMSC names approximately 16,000 National Merit Finalists each February. Of these, about one-half will receive a National Merit \$2,500 Scholarship, a corporate-sponsored scholarship, or a college-sponsored scholarship.

National Achievement Scholars are selected and funded in a similar fashion and represent the nation's outstanding African-American students. Ideally, the National Hispanic Scholars Program should also be included in this category, but it does not track the enrollment of its scholarship winners. Should it do so in the future, we will include these students in *TheCenter's* data. In this study, Merit and Achievement scholarships are credited to the main campus if the NMSC Annual Report does not indicate a branch campus.

While the number of National Merit and National Achievement award winners in the entering class provides an indication of the attractiveness of a university's undergraduate program to outstanding students, it is also an indicator that is sensitive to institutional policies on financial aid. Because the number of Merit Scholars is small, relatively small changes in institutional aid policies can have a significant impact on the number of National Merit Scholars enrolling in institutions. The average SAT score provides a broader-based and more reliable measure of overall undergraduate quality; for those reasons, we prefer the SAT scores to the number of National Merit and Achievement Scholars as an indicator of undergraduate quality.

Institutional Characteristics

Medical Schools

Source: NCES IPEDS Completions Survey, MD degrees awarded between July 1, 2003, and June 30, 2004.

Although the IPEDS Institutional Characteristics Survey does have a "medical" field that indicates whether an institution grants a medical degree, we choose not to use its data because it includes medical degrees in Veterinary Medicine, Dentistry, and other professional health-related fields. For our measure, we determined whether a particular campus awarded any MD degrees during the academic year. If the institution did not submit any data to IPEDS for that year, we then looked at whether it was accredited by the American Medical Association to determine whether the institution has a medical school.

Land Grant Institutions

Source: National Association of State Universities and Land Grant Colleges.

The first Morrill Act in 1862 appropriated federal funds for universities to provide agricultural and technical education to their citizens. A second Morrill Act in 1890 expanded eligibility to include several historically black colleges and universities, and in 1994 several Native American tribal colleges were recognized as land grant institutions. Today, there is at least one land grant institution in each state and U.S. territory and in the District of Columbia. Of the 105 institutions, most are public universities. Federal land grant institutions receive both federal and state dollars in support of their agricultural and extension activities.

While land grant status technically applies to some university systems, such as the University of California and the University of Nebraska, for our study we designate as land grant institutions only those schools that actually perform that function (e.g., UC-Berkeley, UC-Davis, UC-Riverside, Nebraska-Lincoln). In these cases, the land grant field will identify whether an institution is part of a system-wide land grant and whether the vast majority of the activity occurs on that campus. For example, UC-Davis is coded as "Yes-System" while UCLA is coded as "No-System." We consider the 1890 institutions as land grant institutions, but we identify them separately because they do not perform extension activities.

Research Focus

NSF/SRS Survey of R&D Expenditures at Universities and Colleges, FY 2003.

In addition to reporting expenditure data by source of funds, NSF identifies in what major disciplines the money is expended. In the Research by Discipline table (Data Tables, pp. 58), we provide the proportion of total and federal expenditures in each discipline for those institutions with more than \$20 million in federal research. These data are useful for developing groups of similar institutions for peer analysis.

The Institutional Characteristics table (Data Tables, pp. 154) provides a summary measure of an institution's research strength and concentration based on these discipline-level expenditures. Universities with 95-100% of their federal research dollars spent in one particular discipline are coded as "all." We identify institutions with 75-94% in one area as "heavy" and label those with 50-74% of their expenditures concentrated as "strong." Other universities with 25-49% in one or more disciplines we describe as "moderate." A few institutions (but none in the more than \$20 million group) have expenditures distributed fairly evenly across the disciplines; those we code as "mixed."

In some cases, where an institution reports as a multi-campus entity, we made adjustments to break out the discipline-level expenditure data by single campus. Typically, this involved moving all or a portion of the life sciences expenditures to the health or medical center campus. IPEDS fall enrollment and graduate degrees by discipline data also were used to help in this effort.

While these data offer some insight as to the research structure of a university, their usefulness is limited. For example, we may be tempted to use the life sciences as a surrogate for medical research, but we must remember that they also include agricultural and biological sciences. Further, the growing trend toward multidisciplinary and interdisciplinary projects may make it more difficult for universities to accurately reflect expenditures by discipline or sub-discipline. *TheCenter* chooses not to break out these sub-disciplines because the data are increasingly prone to error as further adjustments are made.

Student Characteristics

Fall Enrollment

Source: NCES IPEDS Fall Enrollment Survey, 2003.

Each November, institutions report their current fall headcount enrollment to the IPEDS Fall Enrollment Survey. Enrollment figures include both degree seeking and non-degree seeking students. *TheCenter* provides the headcount enrollment by level as presented by IPEDS, along with the percentage of those attending part-time. Graduate students include those seeking specialist degrees in engineering and education. First professional students include those seeking degrees in medical fields, such as Chiropractic, Dentistry, Medicine, Optometry, Osteopathic Medicine, Pharmacy, Podiatry, and Veterinary Medicine, as well as those seeking degrees in Law and Theology.

Each campus in our study submits enrollment data by campus, except for the few institutions identified in our Data Notes section. Because this is an informational item and not one of *TheCenter's* nine quality measures, we did not attempt to adjust these figures.

Data Notes

The raw data used for *The Top American Research Universities* project—obtained from federal agencies and national organizations—often contain information on single-campus institutions, multiple-campus institutions, and state university systems, without clearly identifying the distinctions. This makes national comparisons difficult and unreliable.

To increase the validity and usefulness of these data, *TheCenter* adjusts the original reported figures, when necessary, to ensure that all data represent the strength of a single-campus institution. *TheCenter* bases its adjustments on information gathered from the reporting agency or from the university itself. In cases where the published data represent a single campus, we do not adjust the data. When the data represent more than one campus, we first attempt to obtain a figure directly from the National Science Foundation (NSF) (for research expenditures and postdoctorates), from the institution itself, or from the university system office that submitted the data. If unavailable from those primary sources, we use an estimated or substitute figure derived from information found on the institution's Web site. As a last resort, we use prior-year data as a substitute.

If the institution provides an estimate representing at least 97% of the originally published figure, we credit the full amount to the main campus. Otherwise, we use the estimate provided by the institution.

TheCenter does not adjust the private university data because of multi-campus or system-wide reporting. We treat all private universities in this study as single-campus institutions because, while some may have multiple campuses, they are generally in or around a single city and considered an integral part of the main campus. Furthermore, private institutions generally do not break out their data by regional, branch, or affiliated campus as often happens with public institutions.

The following tables outline the various adjustments or substitutions that we made to the original data. The tables list institutions alphabetically and include both private and public universities. For the purpose of this report, we provide notes for institutions with more than \$20 million in fiscal year 2003 federal research. Data notes for all other research universities are available on *TheCenter* Web site <http://thecenter.ufl.edu>.

Data Notes for Universities with Over \$20 Million in Federal Research

UNIVERSITY / STATISTIC	Original Data (dollars in thousands)	TheCenter Data (dollars in thousands)	Comments
Arizona State University - Tempe			
2003 Total Research Expenditures (NSF)	\$145,591	\$145,591	Estimate at least 97% is main campus, per institution. All dollars credited to Tempe campus.
2003 Federal Research Expenditures (NSF)	\$71,741	\$71,741	Estimate at least 97% is main campus, per institution. All dollars credited to Tempe campus.
2004 Endowment Assets (NACUBO)	\$247,892	\$247,892	Estimate at least 97% is main campus, per institution. All dollars credited to Tempe campus.

Medical College of Wisconsin			
2004 Endowment Assets (NACUBO)	\$372,535	\$372,535	Large increase from FY2003 to FY2004 is due to a gift of approximately \$320 million.
2004 Annual Giving (CAE VSE Survey)	Not Reported	\$12,200	Data obtained on institution's Web site.
Morehouse School of Medicine			
Endowment Assets Revision			Institution reported FY 03 data for the first time in FY 04 NACUBO survey.
New Jersey Institute of Technology			
Total Research Expenditures Revision			Institution revised FY 02 data in FY 03 NSF survey.
Federal Research Expenditures Revision			Institution revised FY 02 data in FY 03 survey.
New Mexico State University - Las Cruces			
2003 Total Research Expenditures (NSF)	\$108,613	\$108,613	Estimate at least 97% is main campus, with institution's knowledge. All dollars credited to Las Cruces campus.
2003 Federal Research Expenditures (NSF)	\$75,368	\$75,368	Estimate at least 97% is main campus, with institution's knowledge. All dollars credited to Las Cruces campus.
2004 Endowment Assets (NACUBO)	\$110,020	\$110,020	Estimate at least 97% is main campus, per institution. All dollars credited to Las Cruces campus.
2004 Annual Giving (CAE VSE Survey)	\$21,415	\$21,415	Estimate at least 97% is main campus, with institution's knowledge. All dollars credited to Las Cruces campus.
North Carolina State University			
Federal Research Expenditures Revision			Institution revised FY 02 data in FY 03 survey.
North Dakota State University			
2004 Endowment Assets (NACUBO)	Not Reported	\$12,601	Data provided on institution's Web site.
2004 Annual Giving (CAE VSE Survey)	Not Reported	\$9,941	Data provided by institution.

Ohio State University - Columbus			
2003 Total Research Expenditures (NSF)	\$496,438	\$496,438	Estimate at least 97% is main campus, per institution. All dollars credited to Columbus campus.
2003 Federal Research Expenditures (NSF)	\$198,488	\$198,488	Estimate at least 97% is main campus, per institution. All dollars credited to Columbus campus.
2004 Endowment Assets (NACUBO)	\$1,541,175	\$1,541,175	Estimate at least 97% is main campus, per institution. All dollars credited to Columbus campus.
2004 Annual Giving (CAE VSE Survey)	\$206,078	\$206,078	Estimate at least 97% is main campus, with institution's knowledge. All dollars credited to Columbus.
Oklahoma State University - Stillwater			
2003 Total Research Expenditures (NSF)	\$103,079	\$103,079	Estimate at least 97% is main campus, with institution's knowledge. All dollars credited to Stillwater campus.
2003 Federal Research Expenditures (NSF)	\$37,748	\$37,748	Estimate at least 97% is main campus, with institution's knowledge. All dollars credited to Stillwater campus.
2004 Endowment Assets (NACUBO)	\$169,127	\$169,127	Estimate at least 97% is main campus, per institution. All dollars credited to Stillwater campus.
2004 Annual Giving (CAE VSE Survey)	\$41,028	\$41,028	Estimate at least 97% is main campus, with institution's knowledge. All dollars credited to Stillwater.
Oregon Health & Science University			
2004 Annual Giving (CAE VSE Survey)	Not Reported	\$87,100	Data provided by institution. Large increase over FY 2003 due to large land gift.
Oregon State University			
2004 Annual Giving (CAE VSE Survey)	\$51,927	\$51,927	Large increase over FY2003 due to large fund-raising campaign, as well as change in reporting guidelines.
Pennsylvania State University - Hershey Medical Ctr			
2003 Total Research Expenditures (NSF)	\$533,427	\$53,343	Estimate 10% is Hershey campus, per institution. Institution revised FY 02 data in FY 03 NSF survey.
2003 Federal Research Expenditures (NSF)	\$301,094	\$30,109	Estimate 10% is Hershey campus, per institution.
2004 Endowment Assets (NACUBO)	\$1,056,078	\$158,412	Estimate 15% is Hershey campus, per institution.
2004 Annual Giving (CAE VSE Survey)	\$151,268	\$27,228	Estimate 18% is Hershey campus, per institution.
Pennsylvania State University - University Park			
2003 Total Research Expenditures (NSF)	\$533,427	\$480,084	Estimate 90% is University Park campus, per institution. Institution revised FY 02 data in FY 03 NSF survey.
2003 Federal Research Expenditures (NSF)	\$301,094	\$270,985	Estimate 90% is University Park campus, per institution.
2004 Endowment Assets (NACUBO)	\$1,056,078	\$779,174	Estimate 73.78% is University Park campus, per institution.
2004 Annual Giving (CAE VSE Survey)	\$151,268	\$107,400	Estimate 71% is University Park campus, per institution.
Purdue University - West Lafayette			
2003 Total Research Expenditures (NSF)	\$309,476	\$309,476	Estimate at least 97% is main campus, with institution's knowledge. All dollars credited to West Lafayette campus.
2003 Federal Research Expenditures (NSF)	\$129,199	\$129,199	Estimate at least 97% is main campus, with institution's knowledge. All dollars credited to West Lafayette campus.
2004 Endowment Assets (NACUBO)	\$1,207,131	\$1,207,131	Estimate at least 97% is main campus, per institution. All dollars credited to West Lafayette campus.
2004 Annual Giving (CAE VSE Survey)	\$176,051	\$163,727	Estimate 93% is West Lafayette campus, per institution.
Rutgers the State University of NJ - New Brunswick			
2003 Total Research Expenditures (NSF)	\$274,576	\$244,373	Estimate 89% is New Brunswick campus, per institution.
2003 Federal Research Expenditures (NSF)	\$106,060	\$94,393	Estimate 89% is New Brunswick campus, per institution.
2004 Endowment Assets (NACUBO)	\$449,889	\$413,898	Estimate 92% is New Brunswick campus, per institution.
2004 Annual Giving (CAE VSE Survey)	\$73,541	\$63,245	Estimate 86% is New Brunswick campus, per institution.
