INTRODUCTION

The Center for Measuring University Performance at 20 Years

What does it take to be among the most competitive America research universities? What elements define the universities whose performance keeps them at the forefront of academic research? What elements within the organization, structure, and finance of colleges and universities sustain long term success in this exceptionally competitive marketplace?

For the past 20 years, the Center for Measuring University Performance (MUP) has explored a wide range of topics focused on these key issues. During these years we have produced a perspective on these institutions by focusing on consistent and reliable indicators of research performance. While no two research universities are alike, they all compete for the same elements that underlie their success and the prestige derived from that success.

We have not sought to contribute to the endless public relations *Myth of Number One* that hopes to identify a "Best" university by combining a wide range of disparate measures into a single, creatively calculated, rank-ordered list of institutions. Such efforts contribute more to the literature on public relations than to an understanding of the fundamental drivers of research university competition. Nonetheless, the search for a mythical Number One testifies to the tremendous competitive marketplace within which colleges and universities operate.

The research universities we focus on are a small, but critically significant, subset of the American higher education marketplace with about 200 or so universities out of the over 2400 four year non-profit undergraduate and above institutions. This elite group provides useful benchmarks for many reasons as outlined in our annual reports, but most importantly, their characteristics define the elements of institutional quality. We have not attempted to determine whether these definitions are "correct" in some abstract sense or whether they are optimal for social or political purposes. Our goal is less ambitious, being limited to understanding the structure of competition. We have observed that while only a small percentage of institutions qualify as major research universities, the academic quality values of these universities are emulated as much as possible by institutions of widely varying characteristics, at all levels of performance, and serve to define the brand value they advertise to their various audiences.

While we might imagine that the highly competitive research university environment might lead to dramatic changes in the competitive positions of different institutions (an assumption that the commercial ranking industry eagerly promotes), the relative performance of the institutions in this top group of research universities has remained remarkably stable over the years. This stability rests on their consistent focus on the acquisition of scarce talent: faculty, staff, and students. It is the competition for highly productive talented individuals that drives research university success, and our work clearly demonstrates that the key element required for this competition is money.

Although this project focuses on data about the institutional elements that identify top performing research universities (fully described elsewhere in the *Top American Research Universities* annual report), the competition to acquire these institutional assets requires significant investment for the simple reason that all institutions in this marketplace want the same elements and these elements are scarce. The scarcity drives up the cost of acquiring the intellectual academic assets that produce the results delivered by top research universities.

Our perspective has always been on **universities as institutions**, and we have taken the position that the unit responsible for the quality and competitiveness is a campus-based organization. This reflects in part the composition of the American higher education marketplace that contains both public and private, non-profit research universities. Public higher education, being primarily a state-based enterprise, is often organized into systems, or clusters of universities joined by a political-administrative structure that seeks to ensure the achievement of various state educational priorities. For the purpose of understanding the research university marketplace, however, it is the individual campuses within these systems that are the location of most significant academic research activities. Private research universities are almost always individual entities rather than systems.

From the point of view of the competitive marketplace, the issue, for example, is whether UCLA (not the University of California System) is as competitive as Stanford. Moreover, the key personnel who drive university competition (faculty, staff, and students) almost always see themselves as being connected to, recruited by, and engaged with a campus-based institution. While this definition surprises few academics, it has sometimes been an issue with system administrators who seek an advantage in

claiming the success of multiple campus organizations as being equivalent to the success of a competitor's single campus.

We have also explored other differentiating elements of research university structure and organization related to the fields of **medicine and engineering**. Medically related research is a major economic driver of university competition, and universities with research oriented medical schools as part of their campus organization have an advantage. Our work has explored this issue by charting the significance of medical and engineering related research within the competitive context of these top institutions. By separating out the medical and engineering elements in our data, we have been able to provide a better comparative framework for understanding institutional success.

Throughout these years, the MUP Center has followed the various **ranking schemes** that have emerged, both within the US and internationally, recognizing that the state of university competition is of vital interest not only to those inside the US, but also to national governments around the world who see research universities as generators of national prosperity and international significance. Although the data sets used by various other national and international comparative studies of university research competitiveness provide a useful perspective, the variations in data definition and collection complicate multinational comparisons. MUP participated in the design of an international comparative university data analysis project for a few years that offered some insights into the global competition for academic research preeminence. In general, we found that even though the details of quality measurement varied significantly, the elements of institutional success remained quite constant--the acquisition of the most productive talented faculty, staff, and students. In the decentralized US system, elements related to the competition for peer reviewed grants and private gifts, for example, serve as useful indicators of institutional resources, but internationally, where many preeminent research universities are substantially state funded entities, a more universal common measure of competitiveness follows faculty/staff productivity reflected in published peer reviewed articles. This metric too has its measurement challenges. Nonetheless, even with the measurement differences, the group of top performing institutions, however measured on research elements, contain most of the same universities. This result reinforces our recognition that the key assets for research preeminence are, as mentioned above, faculty, staff, and students.

Although research universities are not enterprises focused on producing direct monetary profits for its owners, they are intensely focused on **the issue of revenue**. Revenue is the key element required for competitive research university success. Revenue is essential to purchase the top talent and to provide the resources, facilities, support systems, and conditions for their success. Money to purchase the top administrative and operational staff needed to sustain the complex infrastructure required to support the most productive research faculty. Money to buy the context and content that attracts the highest performing undergraduate and graduate student bodies. Our work, as is true of many others who study these elements, has demonstrated clearly that the most competitive research universities also have larger revenues than less competitive institutions.

Along the way over these 20 years we have looked at a variety of other topics. One that early on attracted our interest was what we called the **"Sports Imperative at America's Research Universities."** Not surprisingly, this proved to be among the topics with a wide audience and demonstrated clearly that competitive intercollegiate athletics at the highest levels were a common characteristic of a large percentage of high performing research universities. Yet, while big time college sports may well have been an asset for many top research universities, the existence of a big time college sports program did not appear to be a significant predictor of institutional research success.

We have learned much by developing the analyses that underlie the essays associated with the annual report publications, but the core value of the MUP Center lies in the production of **consistent, reliable, and clearly defined data** on key elements of research university performance. We publish the data in two formats. The annual reports, published in hard copy and distributed without charge to about 1700 individuals in leadership positions in higher education institutions and their organizations, highlight the relative performance of the top institutions (around 200) and identifies universities that score in the top 25 or top 50 on at least ONE of the nine measures we track. This section reflects our observation that high performing institutions pursue high levels of competitive performance in many of the areas we measure. In addition, the printed version provides the complete data set for these top institutions on all nine measures.

However, for many of those interested in these topics, one of the values of the MUP project is the opportunity it gives individual institutions to construct their own comparative

groups to measure their competitive success against a group of institutions matching their own institutional profiles. To that end, we publish a more extensive set of our data online in downloadable Excel workbooks. These tables include current and historical data on all universities receiving any federal research support over the past five years (as of this publication 962 institutions) along with supplemental tables that show financial data in both current and historical amounts. In every annual report, and on our website, we also include a discussion of the sources for the data elements, our methodology, and describe any adjustments we have made to maintain the consistency of the data over time. Over the years, we have seen considerable interest in the MUP online data with the website registering an average of about 300 unique hits per day.

Even as the higher education marketplace confronts multiple challenges over the years, the group of top research universities remains remarkably stable. This **stability** does not reflect a lack of change, but rather the ability to adapt to and take advantage of opportunities brought by changes in the marketplaces for higher education. With their substantial economic resources, their exceptional faculty and staff, and the quality of their students and the resulting alumni, these institutions have managed through major economic downturns, changing student and faculty expectations and preferences, significant modifications of the regulatory environment, and demographic changes to sustain their preeminence.

With each crisis, whether motivated by war or economic challenges, including the present one driven by social critique and the incidence of a pandemic with its inevitable economic consequences, many characteristics of higher education institutions have required significant modification. For the top research universities, however, the consequences of these crises are generally absorbed as the institutions' organizational strength allows them to adapt, modify, and adjust their operations to continue to dominate the marketplace. For institutions with less resources, both financial and personnel, the initiatives needed to adapt require major structural and content modifications of programs and activities.

The stability of the group of top research universities reflects not a resistance to change but the institutional capacity to anticipate, invest, and capture the advantages changes in the marketplace provide. The group of top universities today, may include most of the same institutions as 20 years ago, but the institutions themselves are significantly different as they have been modified over the years to sustain their preeminent position.

We have sustained this work for two decades thanks to the **remarkable support** we have received from the universities that at various times sponsored staff and our work: University of Florida, University at Buffalo, Arizona State University, Louisiana State University System, and University of Massachusetts Amherst. A varied cast of academic experts have helped produce the annual reports and the occasional essays that have accompanied them, greatly enhancing our ongoing conversation about research university competitiveness, and their work is reflected in the publications section of our website.

Above all, of course, we have relied on our Advisory Board, whose annual meetings have guided our work and whose constant readiness to participate in our discussions has been an inspiration. They are listed in the publication and on our website.

We have especially appreciated the many contributions of our Board colleague, Roger Kaufman, and the news of his passing on September 23, 2020, left us all with a profound sadness. Roger was a constant and engaged participant in our work, as he was in so many other activities worldwide. His academic and professional resume reflects a lifetime of service, innovation, creativity, and commitment in many fields and with many organizations. Roger was a true believer in the idea of constant, continuous performance improvement, but he forced us all to consider the larger context within which each of us, in our own organizations, pursue improved performance. Captured in his careful proposals of 'mega planning and needs assessment,' Roger insisted that we should always seek institutional and operational improvement with the larger social good as a primary objective, not just as a desirable side effect. The care and intensity of his work, reflected in both academic publications and practical projects around the world, gave Roger's commitment an undeniably persuasive power and won him widespread admiration and recognition. While it is not possible to adequately summarize Roger's multi-dimensional career and endless record of accomplishments, we who admired his work, enjoyed his company, and appreciated his friendship mourn our loss.

THE UNRECOGNIZED COMPLEXITY OF HIGHER EDUCATION

John V. Lombardi¹, Diane D. Craig², Michael M.E. Johns³, and William B. Rouse⁴

Abstract

Most people think of higher education in terms of applying and getting accepted; taking courses, going to class, earning credits and a grade point average; interacting with faculty members who may also pursue scholarly research; and graduating, going to work, and coming back for homecoming. All these things happen, but the ways in which these activities are resourced and executed varies enormously across the 4,500 institutions of higher education in the United States, even as the structure of the higher education industry is remarkably stable over time. These differences are outlined using various sources of data. We then discuss the implications of these differences in terms of how institutions can best address fundamental change. We show how the strategic options available to different cohorts of institutions vary by resource availability, brand image, and competition.

INTRODUCTION

The plight of the ecosystem of higher education has received much recent commentary. The enormous financial impacts of the coronavirus pandemic have been outlined (Economist, 2020; Edmit, 2020; Potter, 2020). Technology has rescued teaching (Lohr, 2020; Taparia, 2020) in the short term, but rendered the bricks and mortar of academia to be, at least temporarily, of little value. These challenges are happening while the nature and priorities of students may be morphing (Chronicle, 2019; Eakins, 2020).

Although these challenges have been anticipated, the pandemic appears to have greatly accelerated their impact. Christenson (2011), DeMillo (2011), Lombardi (2013), and Rouse (2016) have outlined the challenges and opportunities. Rouse, Lombardi and Craig (2018) employed a computational model of the economics of universities to analyze several strategic options open to various types of players in the ecosystem, concluding that not all players have the same options.

This article addresses the complexity of higher education in terms of resources available, brand images, competition, organizational models, and other attributes. It portrays the enormous variety among 4,500 universities in the US; drawing upon various sources of data. We then discuss the implications of these differences for the ability of institutions to address fundamental change. We show how the strategic options available to different cohorts of institutions vary by resource availability, brand image, and other key characteristics. Finally, we consider how these findings may differentially impact the humanities, medicine, and engineering.

THE ECOSYSTEM OF HIGHER EDUCATION

Significant challenges over the last decade, exacerbated by the pandemic of 2020, have led to a deep reappraisal of the structure and operation of the American higher education industry with the anticipation of required dramatic changes and the possibility of the closure of many small private colleges. To provide a framework for understanding these circumstances, a clear sense of the historical development and current condition of the higher education marketplace is useful.

The Higher Education Industry

America's higher education industry is remarkable for its size, variety, and stability. Over the decades since the close of World War II, institutions large and small, public and private, elite and comprehensive have proliferated. They have expanded and diversified their student populations and created multi-resourced financial models to sustain their operations. The widely varying characteristics of student populations, the emergence of a research intensive subset of universities, and the changing demands of the employment marketplace reflect in the detail of these institutions' programs and finances. However, the fundamental organization and competitive context of the institutions within this marketplace have remained remarkably stable.

As shown in Table 1, since the 1940s the higher education industry has seen student enrollments grow from 1.5 million to 19.7 million (2018, NCES, 105.30). The number of degree granting institutions serving these students has increased from 1,708 in 1940 to 4,042 today (1993, NCES, 26; 2019, NCES, 317.10). While the growth in the number of two-year institutions is higher than four-year institutions over the past 70 years, the overall distribution remains close to what it was in the 1940s at roughly 70% 4-year and 30% 2-year institutions. These data include a category of higher education institution composed of for-profit institutions, mainly offering two-year degree programs in the early years. For-profits grew from 55 in 1977 to a peak of 1,451 in 2013 but by 2019 they had declined by half and now represent 18% of the institutional marketplace, compared to 31% in 2013 and less than 2% in 1977 (2019, NCES, 317.10). Along with enrollment, degrees awarded by higher education institutions have seen tremendous growth, particularly at the graduate level (2019, NCES, 301.20 and 318.40). There is considerable variety of institutional style and operational detail among all these institutions. Many observers imagine that higher education is an industry that responds in similar ways to the challenges and opportunities of the post-secondary marketplace. This notion obscures fundamental differences in the competitive context of colleges and universities. The different types of institutions compete in many different marketplaces, and not all compete in the same marketplaces.

Table 1. Growth in Higher Education, 1940 to Present: Institutions, Students, and Degrees

Approx. Year	# of Degree-Granting Postsecondary Institutions			Enrollment	Degrees Awarded			
	Total	4-year	2-year		Associates	Bachelors ¹	Masters ²	PhD/Prof ³
1940	1,708	1,252	456	1,494,000		186,500	26,731	3,290
1950	1,851	1,327	524	2,659,000		432,058	58,183	6,420
1960	2,004	1,422	582	3,640,000		392,440	74,435	9,829
1970	2,525	1,639	886	8,580,887	206,023	792,316	213,589	59,486
1980	3,152	1,957	1,195	12,096,895	400,910	929,417	305,196	95,631
1990	3,535	2,127	1,408	13,818,637	455,102	1,051,344	330,152	103,508

1 From 1940 to 1960, bachelor's degrees include degrees formerly classified as first-professional, such as M.D., D.D.S., and law degrees

2 Among Master's, figures for years prior to 1970 are not precisely comparable with later data.

3 Includes Ph.D., Ed.D., and comparable degrees at the doctoral level. Includes most degrees formerly classified as first-professional, such as M.D., D.D.S., and law degrees.

4 Institution counts is 2018-19; Enrollment is 2018; Degrees is 2017-18.

The Competitive Marketplaces for US Higher Education

There is considerable variety of institutional style and operational detail among these institutions, but many observers imagine that higher education institutions present a common front when faced with the challenges and opportunities of the post-secondary marketplace. This notion obscures fundamental differences in the competitive advantages of colleges and universities. The institutions compete in many different marketplaces, and while different types of institutions may compete with each other in some marketplaces (such as for student enrollment and international students), they also compete in different markets (such as for research grants and contracts and advanced graduate students and research faculty). While some institutions primarily enroll middle class and modestly prepared high school graduates, others have students drawn primarily from the upper middle class and with superior K-12 preparation.

Even so, the public approach to higher education anticipates that the marketplace, at least for undergraduate and some professional degrees, is composed of more or less interchangeable institutions, each producing two or four-year undergraduate degrees along with other credentials. The institutions of accreditation and various state and federal regulatory organizations reinforce this notion. These organizations impose standardized general criteria that the institutions must appear to meet in order to be eligible for important public funding programs. The perception of uniformity is reinforced primarily through a curricular structure that leads to a four-year degree within a relatively standardized pattern of academic programming from first through fourth years, with increasing specialization towards a major in some discipline anticipated to have a relationship to future employment or advanced educational opportunities.

In a previous study (2019, Lombardi and Craig) we reviewed the challenges of interpreting generalizations about college enrollment and focused on some characteristics that differentiate these institutions. Of the 2,345 four-year, not-for-profit institutions in 2019, 33% are public and 66% are private. These two categories of institutions have much different governance mechanisms, financial structures, and size and scope (Table 2). Eight in nine private institutions (88%) have enrollments less than 2,500 while a similar proportion of public universities and colleges (87%) have more than 30,000 students enrolled. Those with enrollments between these two extremes – 2,500 to 29,999 – are more evenly split between public and private.

Within the more than 10 million undergraduate students enrolled in 4-year non-profit institutions, nearly three in four (73%) are enrolled in public institutions and 27% are in private institutions. However, the nearly three million post-baccalaureate students in these institutions are divided much more evenly with about 53% enrolled in public institutions and 47% at private institutions.

Table 2. Fall 2018 Enrollment at Four-Year Institutions

Institutional Control	No. with Enrollment Less than 2,500	% of Total	No. with Enrollment 2,500 to 29,999	% of Total	No. with Enrollment 30,000 or More	% of Total	Under-graduate	% of Total	Post-baccalaureate	% of Total
Public	160	12%	531	58%	76	87%	7,502,622	73%	1,479,938	53%
Private	1,174	88%	392	42%	11	13%	2,776,499	27%	1,312,591	47%
Total	1,334		923		87		10,279,121		2,792,529	

Source: Digest of Education Statistics, 2019, tables 303.70, 303.80, and 317.40.

The National Center for Educational Statistics (NCES) classifies research universities into two groups based on the Carnegie Classification®, those with very high research and those with high research (Table below). Of the 219 institutions in these two NCES categories in Fall 2018, 120 (55%) had 20,000 students or more, and 65 (30%) had 30,000 or more. Public institutions make up 71% of the universities classified by NCES as having high or very high research performance. In terms of enrollment, the high to very high research universities have 5.2 million students, with the public institutions in these categories enrolling just over 4 million, or about 81%.

Table 3. Institutions with Very High or High Research Activity and Fall 2018 Enrollment

Institutional Control and Research Activity	No. of Institutions	Less than 20,000 Students	20,000 to 29,999 Students	30,000 or more Students	Total Students
Public	155	50	46	59	4,235,722
Very High	81	4	25	52	2,880,371
High	74	46	21	7	1,355,351
Private	64	48	9	6	974,610
Very High	34	22	7	5	645,546
High	30	26	2	1	329,064
All Institutions	219	98	55	65	5,210,332
Very High	115	26	32	57	3,525,917
High	104	72	23	8	1,684,415

Source: Digest of Education Statistics, 2019, table 317.40.

In short, these institutions differ significantly by size and type, with a smaller number of public institutions serving the largest number of students even though there are more private institutions than public institutions. As a result, it is not always helpful to over-generalize about students and institutions when the range of institutional size and their public or private character are significantly different.

Money is often an easy indicator of institutional difference. Writ large, we can look at total expenditures. A major research university like Stanford in California, with a powerful academic medical center, reports operating revenue of \$6.1 billion while a small private college in Springfield, Massachusetts, American International College, reports an operating budget of \$82.8 million.

A perhaps less profound reflection of the range of investments institutions can make is to review the commitments colleges and universities do make to their intercollegiate athletic programs. If we look at what appear to be equivalent institutional investments in high-level sports by the members of the Football Bowl Subdivision of the NCAA Division I (some 130 institutions), we find that highest level of expenditures on intercollegiate athletics by an institution in this division is \$171.4 million while the lowest level is \$14.6 million. This difference of \$156.8 million highlights the wide range of resources available even among what to the public eye might appear to be equivalent university activities.

Content, Context, and Brand Competition

Over the years, the colleges and universities within the higher education industry have changed much about their internal operations in response to changes in the expectations of their principal direct consumer market among parents and prospective students and secondarily in response to the demands of the external marketplace for various skills to be acquired during the undergraduate experience. Because all these institutions respond to the same market forces, their general academic offerings tend to be similar. This content, with many variations on the margin, generally provides a core of a liberal arts education and a specialization in a major, is relatively comparable across institutions, and is reinforced by disciplines such as engineering and health care where external accreditation agencies set specific requirements for all institutions.

Since the academic content is relatively standardized, institutions often focus on differentiating themselves in the marketplace by emphasizing the context within which academic activity takes place. This context translates into a brand value for the institution designed to project a quality perception onto the more or less standardized academic content. This quality perception reflects a range of institutional attributes provided at significant cost. The institution hopes to recover this cost from various sources but especially from tuition, fees, donations, and other institutional revenue.

Among these quality attributes of the context are high visibility and high-quality student activities and a wide range of personal and academic support services that cater to the expectations of parents and students for an enriching student experience. Also significant is a high-quality physical environment of academic, residential, and recreational facilities reflecting a commitment to the comfort and effectiveness of the activities (both academic content and experiential context). Other context characteristics include multicultural support services, employment counseling, and extensive entertainment opportunities. Over the years the importance of a college credential and especially a bachelor's degree has increased. In 1940 less than 5% of individuals 25 years or older held a bachelor's degree or higher while today that number is 36% (2019, NCES, 104.10). More recently, we see that in 1970, about 26% of people 18-24 years of age were enrolled in higher education while in 2018 that percentage had increased to 41% (2019, NCES, table 302.60).

Quality faculty with stellar credentials and especially with research accomplishments serve to enhance the brand of elite institutions by offering students the potential opportunity to engage with the best and brightest minds available. Brand value, then, is one of the key elements differentiating institutions, and it is the ability to sustain the cost of delivering this brand value that sorts institutions into various competitive niches and determines their ability to recruit students and accumulate the resources needed to remain or become more competitive.

Over the years since the post WWII boom in higher education, as the proliferation of institutions increased the significance of the post-secondary educational marketplace, the intense competition for the high-quality assets that produce brand value has driven the costs of higher educational services ever higher. Over the same time period, by 2018, per capita disposable income grew from less than \$8,000 to nearly \$44,000 in 2012 dollars (2018, NCES, 106.60). These pressures and opportunities increased the competition among institutions to attract the most desirable students and encouraged them to invest in as much of the quality elements as their tuition and other revenue could support. Nominal or sticker prices for average tuition and required fees since the mid-1970s for all public 4-year colleges and universities rose from about \$500 to about \$9,000 by 2018-19. For private 4-year institutions, nominal tuition rose from about \$2,000 in the mid 1970's to \$35,000 by 2018-19. In constant 2018 dollars, this represents about a \$5,000 increase among public institutions and a \$24,000 increase among privates, in roughly 40 years (2019, NCES, 330.10).

The constant discussion of tuition costs reflects this competition. The general public press publishes many articles and analyses about the constantly rising tuition prices of public and private universities, accompanied by a strong concern about the debt accumulated by many students and families as they struggle to pay these costs. However, the competition is so strong for high-quality students (who themselves constitute one of the primary quality brand enhancers) that every college and university (elite or not) discounts the published tuition by large amounts and discounts that tuition price for financial need, academic distinction, and other desirable characteristics. That discount rate for first-time, full-time freshmen has consistently risen over the years and by the first decade of the twenty-first century even public institutions had average discount rates of about 18%. Private college and university discount rates, from a much higher sticker price base, reached a new high of 52.6% in 2018. These discount rates are a reflection of the expectation that the market will regard a high published tuition price as a prestige marker, even though average tuition actually collected is substantially lower. Also, some constituencies such as international students do pay the full sticker price (2019, College Board).

Institutions use the discount process as negotiating leverage with desirable students to construct the highest quality class with the most attractive composition of student characteristics possible. Financial need is a primary criterion for tuition discounts, but the goal here is to attract students with high potential but lower family financial resources. The purpose is always to acquire the highest quality students available, using the tuition discount to make attendance possible for high need, high-quality students and make attendance attractive for low need, high-quality students. Selective institutions with more qualified applicants than they can accept use tuition discounts to ensure that each entering class has the composition of race, class, gender, and academic credentials that will maintain brand value.

This process also includes the provision of a wide range of debt financing, much of it from federal government programs. Average debt levels on graduation are in the range of \$20,000 to \$30,000, which includes the debt incurred for non-tuition expenses related to housing, food, transportation, and other student activities. Four years after graduation most students have either paid off their debt or are paying on their debt, but some percentage, perhaps around 14% of those with debt, have either defaulted or stopped paying. Those pursuing higher degrees or certificates acquire significantly more debt, depending on how long their post baccalaureate programs require, but in general, those with the highest debt have lower default rates than those with lower levels of debt. The marketplace continues to signal that people believe that debt incurred in the pursuit of higher education and on into graduate and professional education is a good investment. (2017, NCES, Stats in Brief)

The successful recruitment of international students has also become a key competitive advantage, and all colleges and universities compete to acquire these students. International students tend to pay full tuition and fees and, for the most part, they have been filtered for academic preparation in their home countries. The reliance of many US institutions on international students has risen from 1-2% of student enrollment through the 1970's to 5.5% in 2018. As colleges and universities came to rely on these students for both revenue and participation in many STEM graduate programs, any changes in the international marketplace posed a significant threat to budgets and programs. However, as shown in Table 4, the largest number of international students come to doctoral granting institutions, in large part to pursue more advanced studies than available in their home countries (2019, Open Doors: Report on International Educational Exchange, Institute for International Education, New York).

Table 4. International Students by Institutional Type: AY 2018-19

Level of Institution	International Students Enrolled	% of Total
Doctorate-granting	791,777	72%
Master's	147,090	13%
Baccalaureate	35,614	3%
Associate's	86,351	8%
Special Focus	34,467	3%
Total	1,095,299	100%

Persistence of Preeminence

Over time, the competition for brand enhancing characteristics (whether students, faculty, programs, research activity, facilities, or support systems) has driven college and university costs higher, and only the most well-resourced institutions can sustain the cost of the highest levels of brand quality. The principal sources of funding for all institutions are tuition and fees, state and federal instructional support, private gifts and grants, and federal, state, or private research support. As the higher education industry evolved from the post WWII period until today, the differential ability of institutions to subsidize brand value, has led to clearer definition of institutional positions within the general higher education marketplace.

High brand value institutions established their preeminence early in the post war years, and the top performers continued to sustain their relative position at the top of the brand hierarchy by capturing larger shares of educational and research revenue from all sources. As a result, the hierarchy of institutions (based on research preeminence, a surrogate for brand value) has remained remarkably stable over the years, with some rearrangement among those at the top but with relatively few falling out of the competition and relatively few rising up into the high brand value group.

A review of *The Top American Research Universities* for the past 20 years, illustrates this stability well. The benchmarking project examined the performance of research universities with federal expenditures of more than \$40 million annually (increased from \$20 million in 2008) on nine quality measures, all of which speak to the institution's brand value. Overall, 187 different institutions have met the cutoff since the project began in 2000 and the membership in this group has remained remarkably consistent, with 80% of private institutions and 70% of public institutions remaining in *The Top American Research Universities* group every year. As noted in Table 5, there are a small number of universities competing at the highest levels nationally on a variety of quality indicators over the past two decades. For example, only 30 institutions have ranked in the top 25 nationally since 2000 on National Academy members. On another measure of faculty quality, awards given to faculty from about two dozen programs, we see more competition but even so only 48 out of the top 187 research universities were able to reach the top nationally at least once over the past twenty years. Many of the top research institutions compete successfully at a national level on several measures. Fifteen institutions have ranked in the top 10 on at least one of the nine measures every year, with more than half ranking in top 10 on more than one measure every year.

Table 5. Number of Institutions Ranking in Top 25 or 50 on Quality Measures for Past 20 Years

Top American Research Universities Quality Measures	Top 25 Nationally	Top 50 Nationally
Total Research	34	66
Federal Research	37	62
Endowment Assets	32	64
Annual Giving	42	90
National Academy Members	30	61
Faculty Awards	48	93
Doctorates Granted	41	69
Postdoctoral Associates	43	73
SAT Scores*	41	78

Source: The Center for Measuring Performance, *The Top American Research Universities*, 2000-2019

*If we limit the institutions to our group of 187 that meet the federal research cutoff, the dominance is even more apparent. Twenty-five of the top research universities rank in the Top 25 on SAT all 20 years; 39 rank in the Top 50 all 20 years.

Because the high brand value institutions set the standard for institutional excellence (by recruiting the highest ranked students and the highest performing faculty, creating the most effective administrative support structures, and providing the highest quality physical environments) other institutions seek to emulate as much of this context as possible. The competition, of course, is enhanced by endless and highly publicized ranking schemes that purport to identify the critical components of brand value, but because they all use different criteria, they tend to reinforce the general emulation of the currently regarded top performers.

Crisis and the Higher Education Marketplace

When a crisis strikes, many observers and analysts imagine that this structure of post-secondary institutions and their competitive framework will finally collapse and major structural reform will ensue. Generally, that has not been the pattern. Instead, the top performers find ways to maintain their preeminence and often enhance their brands by adopting a variety of innovative practices on top of the standard programs and activities that have always defined their high brand position. Others, however, with fewer resources and therefore more vulnerable to the transitory shocks of economic and social change, must adapt and attempt significant reconfiguration of their content models and reduce the depth of their context environment to remain competitive and financially viable.

Changes to adjust to financial crises produce innovations in instructional delivery to reduce costs, by reducing the number of high brand long-term faculty and substituting lower brand short-term contingent faculty and by adopting technological innovations such as on-line asynchronous or synchronous instruction for large numbers of students using less expensive instructional personnel. Colleges in search of financial resources seek additional marketplaces among international students, post-25 year old students, graduate or certificate students, many in populations that can be taught in content-intensive modes without the added cost of the high context services expected by traditional undergraduate residential students. They retreat from the loss leader activity of academic research, so important to the high brand value institutions, and reevaluate the context of intercollegiate athletics as a possibly too expensive loss leader for its contribution to the institutional brand.

As these issues have grown ever more intense with recurring crises that have reduced public and private support for traditional higher education institutions, the common definition of what constitutes an undergraduate educational experience becomes less and less sustainable and the differentiation of post-secondary providers grows both more visible and more acute. For the high prestige brand name colleges and universities, change will come, too, but mostly as additions to the core drivers of elite quality and prestige. As the current marketplace continues to place an increasingly high value on specific and often technical expertise, the high brand institutions focus more attention on preparing their students for post-baccalaureate specialization in many fields, giving these graduates leverage for the acquisition of high value employment and, of course, increasing the brand value of the elite institutions that prepares them. The rest of the institutions serving these marketplaces will diverge as colleges and universities with fewer resources engage in significant restructuring, that in many cases may emulate the intense top down analysis and execution models used by highly successful for-profit corporations.

In this process, the internal management models of most colleges and universities will experience significant transformations. Governing boards and public legislators, as we have seen in recent times, become less tolerant of the academic collegial model which places a high value on faculty engagement and consultation (and results in relatively slow decisions driven by academic guild values rather than the metrics of economic efficiency and effectiveness). Employees, whether faculty or staff, have and will continue to increasingly emphasize allegiance not to the institution and its values but to the corporate benefits the institution can provide, negotiated and managed not by collegial practices but by corporate/union conflict resolution systems.

Some of this will also affect the high brand value institutions, as they too suffer the consequences of economic dislocation and other environmental challenges, but their responses will be attenuated by their large investment in and support for the elements of high value brand recognition: research, faculty quality, student quality, and in many cases, high visibility sports.

The result of these changes for the structure of the American higher education industry will vary. Money always lies at the core of these issues, and the money comes from the ability of institutions to sell their products (both tangible and intangible) into a wide range of different marketplaces. Key marketplaces in addition to student tuition and fees include: philanthropy, research support from all sources, and state tax-based public funding for community colleges through to major public research universities. In addition, the hiring preferences of employers in almost every area of American life have made some college education a required token for reasonable employment, and four-year college completion a preferred entry into middle-class careers.

In the search for new markets, many institutions will continue to expand their off-campus online offerings both for traditional students for whom the cost of on-campus education may be too high but more importantly for capturing adult students who did not finish college or those who need additional certifications to improve their marketability. These additional off-campus instructional programs deliver that institution's brand to wider audiences without incurring the cost of a dramatic on-campus expansion. Moreover, many private online providers can leverage their technical expertise in exchange for the legitimizing value of major campus brands.

All colleges and universities, especially those below the top-level brand institutions, will need to approach these marketplaces with structured, organized, and data driven systems, prepared to implement the necessary actions to compete successfully. There are many constraints on rapid change in this industry, and as mentioned at the outset, some smaller private institutions will not survive because they have not prepared for institutional change sufficiently and will not be able to fund the costly investment needed to become competitive. Some significant number will arrive at the moment of need to change having already fallen too far behind to reinvent themselves for the future.

ECONOMICS OF HIGHER EDUCATION

Academic institutions typically have a variety of sources of revenue, with the highly ranked institutions often having greater amounts from each source. Nevertheless, as Derek Bok, President of Harvard, noted “Universities share one characteristic with compulsive gamblers and exiled royalty: there is never enough money to satisfy their desires” (Bok, 2003).

Tuition: In general, tuition in public universities is subsidized from all sources of revenue including state dollars. Historically state dollars have subsidized all university costs sufficiently that tuition for in-state students was relatively low while out-of-state was significantly higher. Also, historically, public universities did not seek endowments and so the endowments of private universities served to subsidize costs while tax dollars subsidized some costs for public universities. For this reason, among some others, public universities tended to be larger undergrad enterprises than private universities because the state wanted to offer instruction to as many citizens as possible.

Endowments: Use of endowment earnings can be restricted to specific uses, for example, endowed faculty chairs often have restrictions on only using earnings to support the research of the faculty member holding the chair. Unrestricted endowment earnings can be used for any purpose. Universities have different payout policies from endowments but most cluster around 5%.

Gifts: Private funding of universities includes annual giving and unrestricted giving that is not in endowments but in direct payments. Most universities’ Annual Funds fit in this category.

Sponsored Research: All sponsored research with very few exceptions requires a subsidy from the institution to cover costs. Some contract research for the private sector does come with full overhead but it does not make up for the loss from Federal research, let alone the loss from state and local funding which often does not include any overhead at all. Also many foundations sponsor research but exclude indirect costs. Nevertheless, these funds are critical to the research reputation of an institution and, consequently, its brand value.

Athletics and Licensing: Division I football makes money at many, although not all, institutions. However, only about 24 or so universities break even or better on their sports programs. Most lose money. All women’s sports lose money. All Olympic sports lose money. All Division III sports lose money. However, this activity is a brand enhancer of some significance.

Brand Value: Higher brand value tends to increase willingness to pay higher tuition and also enhances faculty recruitment. Brand value does translate into higher demand from everyone. Brand value has been found to correlate with faculty publications and citations of those publications, hence the importance of research funding (Rouse, Lombardi and Craig, 2018).

Institutional Cohorts

Table 6 summarizes three cohorts of institutions – termed strong, decent, and marginal. The measures used to sort universities into these cohorts were total research expenditures, federal research expenditures, endowment assets, median student SAT scores, major faculty awards, and number of members in the National Academies on Science, Engineering, and Medicine. The sorting criteria are indicated in the note below the table.

The three cohorts are starkly different in terms of the human and financial resources they can devote to addressing the future. The intellectual abilities of students differ substantially across cohorts. Differences in faculty accomplishments are enormous. The strong cohort includes a bit over 2% of all institutions, yet includes among its faculties roughly two-thirds of the members of the National Academies on Science, Engineering, and Medicine. Ten of this cohort have almost one-third of the members. These human resources consume but also generate the enormous financial resources indicated in Table 6.

These types of differences have substantial effects upon the options an institution has to address challenges. We revisit these three cohorts when we later address the possible futures for each cohort.

Table 6. Institutions by Brand Category: Performance on Key Brand Indicators

Number of Institutions in each Brand Category/Brand Indicators	Average of Each Indicator within Brand Category					
	2018 Total Research (000s)	2018 Federal Research (000s)	2018 Endowment Assets (000s)	2018 Median SAT	2018 Faculty Awards	2018 National Academy Members
Strong (6% N=98): Strong balance sheet (reflected by endowment, sponsored research success, selective student demand and preferred faculty employer) likely due to strong brand image, particularly in terms of faculty accomplishments	\$526,431	\$297,552	\$4,162,591	1354	16	43
Decent (77% N=1194): Decent balance sheet (reflected by endowment, good sponsored research, good selective student demand, and reasonable faculty employer) likely due to middle of the road brand image, partially in terms of faculty accomplishments	\$11,202	\$5,626	\$210,894	1148	1	0
Marginal (17% N=273): Marginal balance sheet (reflected by endowment, very low sponsored research, modest selective student demand, and tolerable faculty employer) likely due to modest brand image, with modest faculty accomplishments	361	181	27,793	1043	0	0

Note on methodology: Institutions in analysis include the 1565 Carnegie institutions excluding Bacclaureate/Associate's, Associate's and Special Focus Institutions. Institutions were then ranked on all six measures, and for each measure, divided into quartile groups based on institution counts. For each institution, determined if it fell into the top 25% or bottom 50% on four measures: 1) total research or federal research, 2) endowment assets, 3) median SAT scores, and 4) prestigious faculty awards or National Academy members.

Strong institutions (6% of total institutions) represents institutions that placed in the top 25% on all four measures.

Marginal institutions (17% of total institutions) represents institutions that placed in the bottom 50% on all four measures.

Decent institutions (77% of total institutions) represents institutions that did not place in the top 25% or bottom 50% on all four measures.

CULTURE OF HIGHER EDUCATION

The culture of higher education has slowly evolved over the past 1,000 years (Rouse, 2016). For example, the structure of the University of Bologna formulated in 1088 persists today in most institutions.

Governance: The details and distribution of power and influence varies by institution and institutional traditions. In all institutions, however, the Board of Trustees or Regents has the final authority. Shared governance (as it is called) simply codifies the bureaucratic structure that permits various constituencies (faculty, staff, students, alumni etc.) to have a voice of some kind in the process. In most places faculty de facto control the curriculum, promotion and tenure, and hiring of faculty, but some of this authority is being eroded for the sake of management efficiency and authority.

Promotion and Tenure: In the 1970s, roughly 80% of faculty members were in tenure tracks; this has fallen to 20% or so. At the same time, the “rules of the game” have tightened, e.g., a threshold number of publications in a discipline-defined small set of highly ranked journals, funding from NIH or NSF, average teaching ratings of 4 or above on a 5 point scale. There have been many discussions of replacing tenure with 5 year rolling contracts, extended by a year each year that a faculty member performs acceptably.

Student Expectations: Many expect a traditional liberal education, laced with fraternities, sororities, and sports. Others are oriented towards gaining knowledge and skills to secure well-paid employment. Of late, the balance seems steadily shifting towards vocational aspirations. Student expectations of teaching quality have increased as the Internet has enabled them to sample the best of the best.

Corporatization: The Responsibility Centered Management (RCM) model of budgeting is premised on all revenue-generating units being wholly responsible for managing their own revenues and expenditures. They pay “taxes,” typically as a percent of revenues, to support non-revenue-generating units. Unit leaders often find this acceptable, perhaps even attractive, when revenues are growing. This model can be challenging when revenues are declining.

CHALLENGES

There are always challenges, particularly in organizations with many perceptive and creative people who can always think of new things to offer, often with little revenue to support them. There are several other concerns that consume the attention and time of academic institutions.

K-12 Deficiencies: Evidence of poor preparation is pervasive but especially in terms of completion rates. However, the demand that everyone who enters should graduate and get a degree disguises some of this. Institutions spend very large amounts on support services to compensate for the poor preparation of many of their students.

Increasing Demands for Services: Beyond the normal educational services, there are health services, including mental health, career counseling, placement services, dispute resolution services, managing intramurals and clubs, etc. These services require staffing, facilities, and budgets. This obviously increases costs, but seldom revenue. Consequently, tuitions and fees have to cover these costs.

Increasing Oversight and Compliance: Activities associated with university accreditation, discipline-specific accreditation, certifications of workload distributions, auditing of travel expense reports, compliance with policies and procedures, e.g., format requirements for promotion and tenure cases, and sundry other forms, signatures, etc. consume significant faculty and staff time. The worst situation is a culture of compliance laced with administrative incompetence.

Increasing Contingent Faculty: Universities’ budgetary challenges have resulted in increased reliance on adjuncts and part-time faculty whose salaries are contingent on adequate enrollments in the courses they are slated to teach. Further, their salaries are substantially lower than tenure-track faculty. Consequently, 25% of adjuncts across the US are receiving some form of public assistance, typically food stamps and Medicaid. This situation has prompted unionization efforts for faculty, staff, and graduate students, which tends to undermine the collegial climate that was highly valued.

Costs-Benefits Questioned: The costs of higher education have risen much faster than incomes and the other costs of living. As a result student loan debts now exceed US credit card debts. This has caused students and parents to question the benefits of higher education. The return on investment (ROI) on an earned degree is still quite positive. However, seeing this return depends on completing the degree. It does seem that the “tuition bubble” will burst at some point (Rouse, Lombardi and Craig, 2018)

Improving Educational Technology: The pandemic has caused many to recognize that online learning is better than expected. With adequate investments, online programs can provide functions and features that are seldom available in traditional classrooms. These programs can often be hosted on platforms developed by major institutions, e.g., Coursera, edX, and Udacity. The technology enables much larger classes, e.g., 10,000 in Georgia Tech's online MS in computer science. This enables much lower tuition, e.g., \$7,000 for the whole MS degree at GT.

Decreasing Foreign Students: Increasing equity of foreign institutions, immigration headaches in the US, and now pandemic worries will steadily decrease enrollments of full tuition paying foreign students, threatening almost \$50 billion of revenue to US universities. Educational technology can enable recruiting students without their being in the US, but the acceptable tuitions for such offerings will likely challenge many institutions.

POSSIBLE FUTURES

The strong, decent, and marginal university cohorts defined earlier – in terms of resources available to adapt to change – do not all have the same options available. As shown in Table 7, institutions in the strong cohort have the resources – and confidence – needed to lead experimentation and evolution of innovative new business models. Institutions in the decent cohort understand change is in the offing and will be a faster follower of successes to the extent that resources allow. Institutions in the marginal cohort will struggle to sustain their current business model, which is seriously threatened.

Table 7. Strategies Versus Cohorts

Strategies	Cohorts		
	Strong	Decent	Marginal
Sustain Current Business Model	Recognizes Needs to Evolve	Priority <u>But</u> Will Entertain Changes	Highest Priority if Possible
Experiment, Learn Quickly and Adapt	Leads Delivery Innovations	Fast Follower of Successes	Slow Follower of Successes
Disrupt Current Business Model	Resources Available	Resources Unavailable	Resources Unavailable
Move Online <u>With</u> Contingent Faculty	Selectively Attractive	Increasingly Attractive	Increasingly Necessary

Disciplinary Differences

We imagine that different disciplines will address change in different ways, in part greatly dependent on the university cohort in which they are located. The disciplinary roots of the three of us are humanities (Lombardi), medicine (Johns), and engineering (Rouse), so have chosen to address these disciplines. However, we expect that schools of business and law will also face similar challenges. Nevertheless, the investments by discipline may differ significantly as shown in Table 8.

Online Education. All disciplines will necessarily have to entertain greater use of online teaching as the response to the pandemic has prompted. However, disciplines may differ in emphases. Some of these differences will be driven by the differing content employed in the curricular of these differences. Also of great importance will be the extent that face-to-face interactions are central to each discipline and the extent to which these interactions can be technologically mediated.

Interactive Technologies. Advanced technology can enable compelling interactive portrayals of phenomena ranging from chemistry and physics, to human physiology and behaviors, to social and cultural interactions. These interactive technologies can augment reality and provide profound educational experiences. The quality of these immersive portrayals has steadily improved and the costs, at least on widely available platforms, have progressively decreased. The economics of such technologies depend, however, on the number of students across which costs can be amortized.

Knowledge Management. Information access and knowledge management are challenges across disciplines, although the nature of data and knowledge artifacts differ substantially across disciplines. In particular, the technological infrastructure associated with science and technology has benefitted from enormous investments. Humanities have seen important investments and innovations but not at all on the same scale. Of particular note, the data and knowledge artifacts of the humanities were seldom originally created digitally.

Process Improvement. Process modeling and improvement initiatives are significantly affected by two factors. One is the extent to which educational processes are interwoven with operational processes. This is greatest for medicine where much of education happens during delivery of clinical services. In engineering, considerable research happens with industry and undergraduate cooperative education programs. Humanities have few similar processes and thus can be approached in a more straightforward manner.

The second factor is scale. When an undergraduate major, e.g., electrical, industrial, or mechanical engineering, has well over 1,000 students in one department, technology investments can be amortized across many students and, thereby, justify much greater investments. If such institutions are also well resourced, i.e., Cohort 1, the human and financial resources can be marshaled to undertake these investments.

Table 8. Example Investments in Innovations Versus Disciplines

Potential Investments	Discipline		
	Humanities	Medicine	Engineering
High-quality online offerings to support both virtual and in-person education, including support for group work	High-quality virtual materials from selected pre-industrial civilizations representing Asia, Africa, North and South America, Europe, and Middle East	Virtual classrooms for both lecture and small group discussion, including the “art of clinical reasoning” and actual “rounds” on patients virtually with focus on developing tactic knowledge	High-quality online offerings, with seasoned, talented instructors interspersed with demonstrations, experiments, and group discussions and work
Advanced interactive technology to support of experiences, demonstrations, experiments, etc.	Augmented reality based interactions with art, history, geography, culture, language to enable students to experience other times, places and cultures	AI-based patient simulators so students can experience any disease and morbidity despite no current patient having it, including all types of personalities and even disabilities not associated with the disease or morbidity	Computational laboratories for every engineering discipline that provide access to hardware such as robots, powertrains, electronics, integrated circuits, and manufacturing processes
Advanced technology for accessing data, information, and knowledge	Easily accessible databases of texts, material culture, artifacts. Virtual reproductions of art, music, theater, popular culture with capability for individual interaction to create virtual experiences within the cultural context of the objects to engage particular themes, values, and behaviors	Content aggregation, text analytics, and machine learning for access and interpretation of millions of published articles across the breadth of medicine and related sciences	Content aggregation, text analytics, and machine learning for access and interpretation of millions of published articles across the breadth of engineering and science
Process modeling and reengineering across every process in the institution to streamline services and decrease costs	Evaluate tradeoff between student-mentor engagement with humanistic subjects and large scale technology enabled humanistic activity	Reduce redundancy and non-relevant clinical experiences in medical school and residency training to reduce student costs and years needed to enter clinical practice	Represent student flows through each curriculum in terms of knowledge, skills and experiences gained and the costs of delivering these outcomes; focus on increasing efficiencies without losing quality

Impacts on Ecosystem of Higher Education

We expect increased enrollments due to technology-enabled easier access and potentially lower priced tuitions – see Georgia Tech example. With continuing pressures to control costs, there will be a steadily decreasing tenure-track faculty workforce, with the possible exception for institutions in the strong cohort.

Technology and outsourcing will result in steadily decreasing staff positions. Decreased investments in bricks and mortar will inevitably lead to fewer support staff. Overall university employment will decline, with possible exceptions in medicine where clinician deficits are projected, and possibly engineering with steadily increasing demands for STEM education.

Impacts on US Global Competitiveness

The overall result will be a better-educated workforce due to increased enrollments. There will be increased workforce diversity due to easier access and lower prices. This will lead to an increasingly healthy, educated, and productive workforce that is competitive in the global marketplace. With faculty positions becoming scarcer, there will be increased placement of PhD graduates in industry and government. This will lead to enhanced technology transfer and innovation due to broadened placement of research talent. Industry and government demand for professional graduate degrees will increase with easier access and lower prices.

CONCLUSIONS

The unrecognized complexity of higher education is due to several factors. Higher education is complex in terms of differing human and financial resources by cohorts. Higher education is complex due to inclinations and abilities of different disciplines to adapt to change. These differences suggest that a “one size fits all” set of higher education policies will poorly align with this complexity. Policies need to be tailored to these differences to be fully effective.

The changes portended here will require strong leadership, as this is the key to fundamental change (Rouse, 2011). Marginal leaders can muddle through great times, but tend to falter in challenging times, e.g., (Furstenberg, 2020). Great leaders are needed to address challenging times (Barsh, Mogelof and Webb, 2010; Rao and Sutton, 2020).

The anticipated changes will be challenging, in part because higher education is no longer a “sacred cow” in society. Despite the importance of higher education to prosperity, it has to adapt to the realities of change. The likely changes will likely be rather disruptive. However, the net effects will be positive.

Part I – The Top American Research Universities

The Center for Measuring University Performance determines the Top American Research Universities by their rank on nine different measures: Total Research, Federal Research, Endowment Assets, Annual Giving, National Academy Members, Faculty Awards, Doctorates Granted, Postdoctoral Appointees, and SAT scores. (The Source Notes section of this study provides detailed information on each of the nine indicators.) The tables group research institutions according to how many times they rank in the top 25 on each of these nine measures. The top category includes those universities that rank in the top 25 on all nine indicators. The bottom category includes universities with only one of the nine measures ranked in the top 25. Within these groups, institutions are then sorted by how many times they rank between 26 and 50 on the nine performance variables, with ties listed alphabetically. A similar methodology produces a second set of institutions—those ranked 26 through 50 on the same nine measures.

For the purpose of this study, *The Center for Measuring University Performance* includes only those institutions that had at least \$40 million in federal research expenditures in fiscal year 2017. This is the same dollar cutoff used since the 2008 report. There were 163 institutions who met our criteria, 115 public and 48 private.

The first two tables list each institution with the most current data available for each measure and its corresponding national rank (i.e., rank among all institutions regardless of whether they are privately or publicly controlled). The third through sixth tables provide the same nine data measures but with the groupings determined by the control rank (i.e., rank among all private or all public institutions). Institutions ranking in the top 25 on at least one measure are included in the tables with the (1-25) identifier, while those ranking 26 through 50 are found in the tables labeled with the (26-50) header. Many research universities rank highly both nationally and among their public or private peers, and therefore appear in more than one table.

- **The Top American Research Universities (1-25)** identifies the 48 institutions (24 private, 24 public) that rank in the top 25 nationally on at least one of the nine measures.

- **The Top American Research Universities (26-50)** identifies the 30 institutions (8 private, 22 public) that rank 26 through 50 nationally on at least one of the nine measures.
- **The Top Private Research Universities (1-25)** identifies the 32 private institutions that rank in the top 25 among all private universities on at least one of the nine measures.
- **The Top Private Research Universities (26-50)** identifies the 6 private institutions that rank 26 through 50 among their private counterparts on at least one of the nine measures.
- **The Top Public Research Universities (1-25)** identifies the 46 public institutions that rank in the top 25 among all public universities on at least one of the nine measures.
- **The Top Public Research Universities (26-50)** identifies the 24 public institutions that rank 26 through 50 among their public counterparts on at least one of the nine measures.
- **The Top Medical and Specialized Research Universities** tables identify the institutions that have at least one measure that ranks in the top 50 nationally or among their private and public counterparts.

Data found in these tables may not always match the figures published by the original source. *The Center for Measuring University Performance* makes adjustments, when necessary, to ensure that the data reflect the activity at a single campus rather than that of a multiple-campus institution or state university system. When data are missing from the original source, *The Center for Measuring University Performance* may substitute another figure, if available. A full discussion of this subject, and the various adjustments or substitutions made to the original data, is in the Data Notes section of this report.

The Center for Measuring University Performance presents these tables, along with prior years' top universities, in Microsoft Excel spreadsheets on its website [<http://mup.umass.edu>].

Part II – The Center for Measuring University Performance – Research Universities

The Center for Measuring University Performance's research universities consist of academic institutions that had more than \$40 million in federal research expenditures in fiscal year 2017. In the following tables, institutions are listed alphabetically with the most current data available on each measure and their rank on each measure for each year. *The Center for Measuring University Performance* provides both the national rank (rank among all universities) and the control rank (rank within private or public universities). We include five years of data for each measure, which correspond to the same data years used in each of the five prior *The Top American Research Universities* reports. In addition to the nine performance variables presented in Part I tables, these tables also include other institutional characteristics related to student enrollment, medical schools, land grant status, ownership, research focus, and National Merit and Achievement Scholars. The Source Notes section of this report provides detailed information on each data element. Tables in this section include the following:

- **Total Research Expenditures** (2013-2017)
- **Federal Research Expenditures** (2013-2017)
- **Research by Major Discipline** (2017)
- **Endowment Assets** (2014-2018)
- **Annual Giving** (2014-2018)
- **National Academy Membership** (2014-2018)
- **Faculty Awards** (2014-2018)
- **Doctorates Awarded** (2014-2018)
- **Postdoctoral Appointees** (2013-2017)
- **SAT Scores** (2013-2017)
- **National Merit and Achievement Scholars** (2014-2018)
- **Change: Research** presents trend data on total, federal, and non-federal research (2008 and 2017) in constant dollars.
- **Change: Private Support and Doctorates** provides trend data on endowment assets (2009 and 2018) and annual giving (2009 and 2018) in constant dollars, and doctorates awarded (2009 and 2018).
- **Change: Students** includes trend data on median SAT scores (2008 and 2017), National Merit and Achievement Scholars (2009 and 2018), and student headcount enrollment (2008 and 2017).
- **Institutional Characteristics** includes state location, highest degree offered, medical school and land grant status, federal research focus (summary of federal research by discipline), and total student enrollment.
- **Student Characteristics** provides headcount enrollment data broken out by level (i.e., undergraduate and graduate), part-time enrollment by level, and degrees awarded.
- **The Center for Measuring University Performance** measures presents the number of times a university ranks in the top 25 (or 26-50) on the nine quality measures in this year's report as compared to the past five years (i.e., 2014-2018 reports).

Data found in these tables may not always match the figures published by the original source. *The Center for Measuring University Performance* makes adjustments, when necessary, to ensure that the data reflect the activity at a single campus rather than that of a multiple-campus institution or state university system. When data are missing from the original source, *The Center for Measuring University Performance* may substitute another figure, if available. A full discussion of this subject, and the various adjustments or substitutions made to the original data, is in the Data Notes section of this report.

The prior years' data or ranks may differ slightly from our last report due to revised figures or estimates from the data source or institution.

The Center for Measuring University Performance's website [<https://mup.umass.edu>] provides these same tables in Microsoft Excel spreadsheets for ease of analysis. In addition to the over-\$40-million group, the online tables contain data on all institutions reporting any federal research in the past five years.

Part III – The Top 200 Institutions

The following tables list the top 200 universities and colleges on each of the nine performance measures, along with National Merit and Achievement Scholars. (The Source Notes section provides detailed information on each of the 10 data elements.) Unlike the previous tables in Parts I and II, this section includes data for all academic institutions regardless of their federal research activity level.

The Center for Measuring University Performance provides each institution's rank nationally among all universities as well as its rank by institutional control (i.e., rank among private or public peers). In cases where several institutions tie for last place, we use a different cutoff point. For National Academy members, we list all institutions with at least two National Academy members among their faculty. Tables in this section include:

- **2017 Total Research Expenditures**
- **2017 Federal Research Expenditures**
- **2018 Endowment Assets**
- **2018 Annual Giving**
- **2018 National Academy Membership**
- **2018 Faculty Awards**
- **2018 Doctorates Awarded**
- **2017 Postdoctoral Appointees**
- **2017 SAT Scores**
- **2018 National Merit and Achievement Scholars**

Data found in these tables may not always match the figures published by the original source. *The Center for Measuring University Performance* makes adjustments, when necessary, to ensure that the data reflect the activity at a single campus rather than that of a multiple-campus institution or state university system. When data are missing from the original source, *The Center for Measuring University Performance* may substitute another figure if available. A full discussion of this subject, and the various adjustments or substitutions made to the original data, is in the Data Notes section of this report.

The Center for Measuring University Performance presents these tables, along with the prior years' top 200, as Microsoft Excel spreadsheets online at [<http://mup.umass.edu>].

The Top 200 Institutions – Total Research Expenditures (2017)

Top 1-50 Institutions in Total Research Expenditures	Total Research x \$1000	National Rank	Control Rank	Institutional Control
Johns Hopkins University	2,556,641	1	1	Private
University of Michigan - Ann Arbor	1,434,535	2	1	Public

Source Notes

Total Research Expenditures Federal Research Expenditures

Source: Higher Education Research and Development (HERD) Survey, FY 2017

Each year, the National Science Foundation (NSF) collects data from hundreds of academic institutions on expenditures for research and development in science and engineering fields and classifies them by source of funds (e.g., federal government, state and local government, industry, etc.). These data are the primary source of information on academic research and development (R&D) expenditures in the United States. Included in this survey are all activities specifically organized to produce research outcomes that are separately budgeted and accounted for. This “organized research” may be funded by an external agency or organization (“sponsored research”) or by a separately budgeted organizational unit within the institution (“university research”). This report excludes activities sponsored by external agencies that involve instruction, training (except training in research techniques, which is considered organized research), and health service, community service or extension service projects.

All Federally Funded Research Labs (FFRLs) are excluded from these academic expenditures data, including the following: Jet Propulsion Laboratory (California Institute of Technology); Los Alamos National Lab, Lawrence Livermore Lab, Lawrence Berkeley Lab (University of California); Software Engineering Institute (Carnegie Mellon); Argonne National Laboratory (University of Chicago); National Astronomy and Ionospheric Center (Cornell); Ames Laboratory (Iowa State University); Lincoln Laboratory (MIT); Plasma Physics Lab (Princeton); and SLAC National Accelerator Laboratory (Stanford). The NSF data no longer classify the Applied Physics Lab (APL) at Johns Hopkins as an FFRL, but federal funds support the vast majority of research conducted there. The APL makes up more than one-half of Johns Hopkins’ total federal R&D expenditures.

While inconsistencies in reporting (known and unknown) do exist here, as in any survey of this type, problems arise mostly when one breaks out the data by source of funds. NSF expects institutions to use year-end accounting records to complete this report, and there are nationally recognized accounting guidelines for higher education institutions. However, there are also countless variations in institutional policy that determine whether the university reports a particular expenditure as coming from one source or another, or possibly not counted at all. Take federal formula funds for agriculture (e.g., Hatch-McIntire, Smith-Lever) as an example. We conducted an informal survey of the appropriate institutions in the Association of American Universities (AAU) and found that two out of eleven land grants did not include any of these federal funds in their 1997 NSF data, while others included all or some of these monies. Because these funds make

up a very small percentage of the total research expenditures in any given year, the impact on our total research rankings is slight. The agriculture formula funds will have a somewhat greater, but still small, impact on the federal research rankings.

We believe that the reporting inconsistencies in the data are relatively minor when using the total research expenditures and the federal research expenditures component. Federal and state government audits of institutional accounting make deceptive practices highly unlikely, even though these entities do not audit the NSF data directly. NSF goes to great lengths to verify the accuracy of the data, especially federal expenditure data—checking them against several other federal agencies that collect the same or similar information. In fact, all major federal agencies and their subdivisions submit data to NSF identifying research obligations to universities each year. Historically, the NSF data have tracked very closely the data reported by universities. Further, for their National Patterns of R&D Resources series, NSF prefers to use the figures reported by the performers of the work (that is, academic institutions, industry, nonprofits) because they believe that the performers are in the best position to accurately report these expenditures.

In some sections of this report, these expenditure data are deflated to constant 1983 dollars to show real change over time. While NSF uses the Gross Domestic Price (GDP) implicit price deflator in its reports on federal trends in research, we use the Higher Education Price Index (HEPI) because of its narrower focus. Originally developed by Research Associates of Washington and currently managed by Commonfund Institute, the HEPI illustrates the effect of inflation on college and university operations.¹ In contrast, the GDP implicit price deflator is based on change in the entire U.S. economy and, as noted by NSF itself, “[its] use more accurately reflects an ‘opportunity cost’ criterion [i.e., the value of R&D in terms of the amount of other goods and services that could have been spent with the same amount of money], rather than a measure of cost changes of doing research.”²

Endowment Assets

Source: NACUBO-Commonfund Study of Endowment, endowment market value as of June 30, 2018.

Institutions report the market value of their endowment assets as of June 30 to three different sources, and they quite often use three different values. For this project, we use the NACUBO-Commonfund Study of Endowment because of NACUBO’s long history of reporting endowments of higher education institutions, their emphasis on using audited financial statements, and their focus on net assets (i.e., includes returns on investments and excludes investment fees and other withdrawals). NACUBO conducts its study annually and reports the results each February in the Chronicle of Higher Education.

Another source for endowment assets is the Council for Aid to Education's (CAE) annual Voluntary Support of Education (VSE) survey, cosponsored by the Council for Advancement and Support of Education (CASE) and the National Association of Independent Schools. The VSE survey is useful as a secondary resource because it provides more single-campus data than the other two sources. For those institutions that report a system-wide total to NACUBO, we often use the VSE data to calculate a campus' percentage contribution to the entire system, applying that factor to the NACUBO figure. In other cases, we may substitute the VSE figure when the institution indicates that this is a good data source.

The National Center for Education Statistics (NCES) Integrated Postsecondary Education Data System (IPEDS) Finance Survey also collects information on endowment assets. IPEDS data are released later than other two sources and are used when NACUBO nor VSE figures are unavailable.

In our inaugural report of *The Top American Research Universities* in 2000, we noted the wide variation in the reporting of endowment market value between all three sources. An examination of the 1997 endowment figures showed only one university (University of North Carolina at Chapel Hill) had submitted the same figure to each of the three organizations. In a more recent study of major research universities, we found about one-third of the all institutions report identical figures but just seven universities in our over \$40 million federal research group. In the earlier study, we found that endowment assets reported to IPEDS tended to be lower than NACUBO or VSE data, but this is no longer true. In general, the greater the endowment the likelihood that the figures reported to the three sources will vary. Both studies found no consistent pattern to explain reporting variations among the institutions.

Annual Giving

Source: Council for Aid to Education's Voluntary Support of Education (VSE) Survey, FY 2018.

The Council for Aid to Education (CAE), formerly an independent subsidiary of RAND, has produced the Voluntary Support of Education (VSE) Survey since 1957. The annual giving data include all contributions actually received during the institution's fiscal year in the form of cash, securities, company products, and other property from alumni, non-alumni individuals, corporations, foundations, religious organizations, and other groups. Not included in the totals are public funds, earnings on investments held by the institution, and unfulfilled pledges.

CAE's VSE Data Miner service, available online, provides 11 years of data for all participating institutions. Although this is a

subscription-based service and requires a user ID and password, limited access is available online at [<http://www.cae.org/vse>].

National Academy Members

Source: National Academy of Sciences, National Academy of Engineering, and National Academy of Medicine membership directories for 2018.

One of the highest honors that academic faculty can receive is membership in the National Academy of Sciences (NAS), the National Academy of Engineering (NAE), or the National Academy of Medicine (NAM), formerly known as the Institute of Medicine. All three are private, nonprofit organizations and serve as advisors to the federal government on science, technology, and medicine. Nominated and voted on by active members, newly elected members of these organizations receive life terms. Individuals elected to membership come from all sectors—academia, industry, government, and not-for-profit agencies or organizations. Member election dates are in February (NAE), April (NAS), and October (NAM).

The data collected for these rankings use active or emeritus members at their affiliated work institution, as reported in the online membership directories. In all cases, we were able to determine the specific campus for individual members. We re-check institutional affiliation annually to account for established members who have changed employers or whose membership is no longer active.

Faculty Awards in the Arts, Humanities, Science, Engineering, and Health

Source: Directories or web-based listings for multiple agencies or organizations.

For this category, we collect data from several prominent grant and fellowship programs in the arts, humanities, science, engineering, and health fields. Included in this measure are:

- American Council of Learned Societies (ACLS) Fellows, 2017-18
- Beckman Young Investigators, 2018
- Burroughs Wellcome Fund Career Awards, 2018
- Cottrell Scholars, 2018
- Fulbright American Scholars, 2018-19
- Getty Scholars in Residence, 2018-19
- Guggenheim Fellows, 2018
- Howard Hughes Medical Institute Investigators, 2018
- Lasker Medical Research Awards, 2018
- MacArthur Foundation Fellows, 2018

- National Endowment for the Humanities (NEH) Fellows, 2019
- National Humanities Center Fellows, 2018-19
- National Institutes of Health (NIH) MERIT (R37), FY 2018
- NSF CAREER awards, 2018
- Newberry Library Long-term Fellows, 2018-19
- Pew Scholars in Biomedicine, 2018
- Robert Wood Johnson Policy Fellows, 2018-19
- Searle Scholars, 2018
- Sloan Research Fellows, 2018
- Woodrow Wilson Fellows, 2018-19

While the vast majority of these programs clearly identify a particular campus, in a few instances we used the institution's web-based phone directory to determine the correct campus.

Doctorates Awarded

Source: NCES IPEDS Completions Survey, doctoral degrees awarded between July 1, 2017, and June 30, 2018.

Each year, universities report their degrees awarded to the NCES in the IPEDS Completions Survey. IPEDS provides straightforward instructions for reporting doctoral degrees awarded, and we do not find any inconsistencies in reporting among the universities included in our rankings. IPEDS asks each institution to identify the number of Doctor of Education, Doctor of Juridical Science, Doctor of Public Health, and Doctor of Philosophy degrees awarded between July 1 and June 30.

Most institutions in our study submit degree data by campus or offer doctoral degrees solely or primarily at the main campus.

In addition to doctorate degrees, we present degrees awarded at other levels—associate's, bachelor's, master's, and professional degrees—in the Student Characteristics table.

Postdoctoral Appointees

Source: NSF/Division of Science Resource Statistics (SRS) Survey of Graduate Students and Postdoctorates in Science and Engineering, Fall 2017.

Each year, NSF and NIH collect data from all institutions offering graduate programs in any science, engineering, or health field. The Survey of Graduate Students and Postdoctorates in Science and Engineering (also called the Graduate Student Survey or GSS) reflects graduate enrollment and postdoctoral employment at the beginning of the academic year. Postdoctorates are defined in the GSS as “individuals with science and engineering PhD's,

MD's, DDS's or DVM's and foreign degrees equivalent to U.S. doctorates who devote their primary effort to their own research training through research activities or study in the department under temporary appointments carrying no academic rank.” The definition excludes clinical fellows and those in medical residency training programs unless the primary purpose of their appointment is for research training under a senior mentor.

In the methodological notes for this survey,³ NSF indicates that it verifies the data with the institutional coordinator when dramatic year-to-year fluctuations are noted. In addition, in this data set, it is unclear whether an institution has actually reported zero postdocs or NSF has simply assigned a zero for non-response (rather than imputing by using prior-year or peer data, as described in NSF methodological notes). This year, in cases where we suspect it is not a true zero, we left the field blank.

Although each doctorate-granting campus submits data separately, NSF often aggregates them in its published reports. In all cases, we obtain the single-campus data for these schools directly from NSF.

SAT Scores

Source: NCES IPEDS Survey, SAT and ACT scores for Fall 2017.

IPEDS reports the 25th and 75th percentiles for verbal and quantitative SAT I scores for most institutions in our study. For our measure, we calculated the median of that range. Some institutions report the ACT instead of the SAT to IPEDS and some report both. We selected the test which has the greatest percentage of students reporting. To convert ACT scores, we use a conversion table provided by The College Board⁴ to generate a comparable SAT equivalent score. When an institution submits neither an SAT nor ACT score, we substitute data from other national data sources.

Other Measures of Undergraduate Quality

National Merit and Achievement Scholars

Source: The 2017-18 National Merit Scholarship Corporation Annual Report, which reflects the 2018 freshman class.

The National Merit Scholarship Corporation (NMSC) is an independent, nonprofit organization that awards scholarships to the nation's outstanding high school seniors based on their academic achievement, qualifying test scores, high school principal and counselor recommendations, and their activities, interests, and goals. The NMSC names approximately 15,000 National Merit Finalists each February. Of these, about 8,000 will receive a National Merit \$2,500 Scholarship, a corporate-sponsored scholarship, or a college-sponsored scholarship.

Until it was discontinued in 2015, National Achievement Scholars were selected and funded in a similar fashion and represented the nation's outstanding African-American students. Ideally, the National Hispanic Scholars Program should also be included in this category, but it does not track the enrollment of its scholarship winners. Should it do so in the future, we will include these students in our data. In this study, Merit and Achievement scholarships are credited to the main campus if the NMSC Annual Report does not indicate a branch campus.

While the number of National Merit and National Achievement award winners in the entering class provides an indication of the attractiveness of a university's undergraduate program to outstanding students, it is also an indicator that is sensitive to institutional policies on financial aid. Because the number of Merit Scholars is small, relatively small changes in institutional aid policies can have a significant impact on the number of National Merit Scholars enrolling in institutions. The average SAT score provides a broader-based and more reliable measure of overall undergraduate quality; for those reasons, we prefer the SAT scores to the number of National Merit and Achievement Scholars as an indicator of undergraduate quality.

Institutional Characteristics

Medical Schools

Source: NCES IPEDS Completions Survey, MD degrees awarded between July 1, 2017, and June 30, 2018.

Although the IPEDS Institutional Characteristics Survey does have a "medical" field that indicates whether an institution grants a medical degree, we choose not to use its data because it includes medical degrees in Veterinary Medicine, Dentistry, and other professional health-related fields. For our measure, we determined whether a particular campus awarded any MD degrees during the academic year. If the institution did not submit any data to IPEDS for that year, we then looked at whether it was accredited by the American Medical Association to determine whether the institution has a medical school.

Land Grant Institutions

Source: National Association of State Universities and Land Grant Colleges.

The first Morrill Act in 1862 appropriated federal funds for universities to provide agricultural and technical education to their citizens. A second Morrill Act in 1890 expanded eligibility to include several historically black colleges and universities, and in 1994 several Native American tribal colleges were recognized as land grant institutions. Today, there is at least one land grant institution in each state and U.S. territory and in the District of Columbia. Of the 106 institutions, most are public universities.

Federal land grant institutions receive both federal and state dollars in support of their agricultural and extension activities.

While land grant status technically applies to some university systems, such as the University of California and the University of Nebraska, for our study we designate as land grant institutions only those schools that actually perform that function (e.g., UC-Berkeley, UC-Davis, UC-Riverside, Nebraska-Lincoln). In these cases, the land grant field will identify whether an institution is part of a system-wide land grant and whether the vast majority of the activity occurs on that campus. For example, UC-Davis is coded as "Yes-System" while UCLA is coded as "No-System."

Research Focus

Source: Higher Education Research and Development, FY 2017.

In addition to reporting expenditure data by source of funds, NSF identifies in what major disciplines the money is expended. In the Research by Discipline table we provide the proportion of total and federal expenditures in each discipline for those institutions with more than \$40 million in federal research. These data are useful for developing groups of similar institutions for peer analysis.

The Institutional Characteristics table provides a summary measure of an institution's research strength and concentration based on these discipline-level expenditures. Universities with 95-100% of their federal research dollars spent in one particular discipline are coded as "all." We identify institutions with 75-94% in one area as "heavy" and label those with 50-74% of their expenditures concentrated as "strong." Other universities with 25-49% in one or more disciplines we describe as "moderate." A few institutions (but none in the more than \$40 million group) have expenditures distributed fairly evenly across the disciplines; those we code as "mixed."

In some cases, where an institution reports as a multi-campus entity, we made adjustments to break out the discipline-level expenditure data by single campus. Typically, this involved moving all or a portion of the life sciences expenditures to the health or medical center campus. IPEDS fall enrollment and graduate degrees by discipline data also were used to help in this effort.

While these data offer some insight as to the research structure of a university, their usefulness is limited. For example, we may be tempted to use the life sciences as a surrogate for medical research, but we must remember that they also include agricultural and biological sciences. Further, the growing trend toward multidisciplinary and interdisciplinary projects may make it more difficult for universities to accurately reflect expenditures by discipline or sub-discipline. We choose not to break out these sub-disciplines because the data are increasingly prone to error as further adjustments are made.

Student Characteristics

Fall Enrollment

Source: NCES IPEDS Fall Enrollment Survey, 2017.

Each November, institutions report their current fall headcount enrollment to the IPEDS Fall Enrollment Survey. Enrollment figures include both degree seeking and non-degree seeking students. We provide the headcount enrollment by level as presented by IPEDS, along with the percentage of those attending part-time. Graduate students include those seeking specialist degrees in engineering and education. First professional students include those seeking degrees in medical fields, such as Chiropractic, Dentistry, Medicine, Optometry, Osteopathic Medicine, Pharmacy, Podiatry, and Veterinary Medicine, as well as those seeking degrees in Law and Theology.

Each campus in our study submits enrollment data by campus, except for the few institutions identified in our Data Notes section. Because this is an informational item and not one of our nine quality measures, we did not attempt to adjust these figures.

Federal Research with and without Medical School Research

Source: Association of American Medical Colleges, FY 2017

The Association of American Medical Colleges collects data on federally sponsored research at medical colleges through on the Liaison Committee on Medical Education (LCME) Part I-A, Annual Financial Questionnaire. We calculate each medical school's federal R&D by summing the recorded dollars and a portion of the relative administrative costs. We exclude the not-recorded dollars.

Data Notes

The raw data used for *The Top American Research Universities* project—obtained from federal agencies and national organizations—often contain information on single-campus institutions, multiple-campus institutions, and state university systems, without clearly identifying the distinctions. This makes national comparisons difficult and unreliable.

To increase the validity and usefulness of these data, we adjusted the original reported figures, when necessary, to ensure that all data represent the strength of a single-campus institution. MUP Center bases its adjustments on information gathered from the reporting agency or from the university itself. In cases where the published data represent a single campus, we do not adjust the data. When the data represent more than one campus, we first attempt to obtain a figure directly from the National Science Foundation (NSF) (for research expenditures and post-doctorates), from the institution itself, or from the university system office that submitted the data. If unavailable from those primary sources, we use an estimated or substitute figure derived from information found on the institution's website.

If the institution provides an estimate representing at least 97% of the originally published figure, we credit the full amount to the main campus. Otherwise, we use the estimate provided by the institution.

MUP Center does not adjust the private university data because of multi-campus or system-wide reporting. We treat all private universities in this study as single-campus institutions because, while some may have multiple campuses, they are generally in or around a single city and considered an integral part of the main campus. Furthermore, private institutions generally do not break out their data by regional, branch, or affiliated campus as often happens with public institutions.

The following tables outline the various adjustments or substitutions that we made to the original data. The tables list institutions alphabetically and include both private and public universities. For the purpose of this report, we provide notes for institutions with more than \$40 million in fiscal year 2017 federal research.

Data Notes for Universities with Over \$40 Million in Federal Research

University / Statistics	Original Data (dollars in thousands)	MUP Data (dollars in thousands)	Comments
Auburn University			
2018 Endowment		767,361	Estimate at least 97% is main campus.
2018 Giving		120,435	Estimate at least 97% is main campus.
Augusta University			
2017 Endowment	235,247	227,565	Revised 2017 NACUBO.
Baylor College of Medicine			
2018 Giving		57,654	Substituted data from IPEDS
Cleveland State University			
2018 Endowment		83,970	Substituted 2018 VSE.
Colorado State University - Fort Collins			
2018 Giving		79,063	Substituted data from IPEDS.
Cornell University			
2018 Endowment	7,230,291	5,632,397	Estimate 77.9% based on published documents.
2017 Federal Research	435,355	279,525	Estimate 64.2% based on university documents.
2018 Giving	507,295	410,909	Estimate 81% based on 2018 IPEDS.
2017 Total Research	963,166	591,701	Estimate 61.4% based on university documents.
Icahn School of Medicine at Mount Sinai			
2018 Endowment		748,174	Substituted 2018 IPEDS.
2018 Giving		124,788	Substituted 2018 IPEDS.
Indiana University - Bloomington			
2018 Endowment	2,397,369	1,154,032	Substituted 2018 IPEDS.
2018 Giving	408,462	243,443	Estimate 59.6% based on IPEDS and university documents.
Kansas State University			
2017 Endowment	506,232	450,462	Revised 2017 NACUBO.
Louisiana State University - Baton Rouge			
2018 Endowment	886,387	499,341	Substituted 2018 VSE.
Medical College of Wisconsin			
2018 Giving		17,039	Substituted 2018 IPEDS.
Michigan State University			
2017 Endowment	3,075,113	3,036,532	Revised 2017 NACUBO.
Mississippi State University			
2017 Endowment	470,238	472,000	Revised 2017 NACUBO.
New Mexico State University - Las Cruces			
2018 Endowment		175,633	Estimate at least 97% is main campus.

Data Notes for Universities with Over \$40 Million in Federal Research			
University / Statistics	Original Data (dollars in thousands)	MUP Data (dollars in thousands)	Comments
New York University			
2017 Endowment	3,991,638	3,992,000	Revised 2017 NACUBO.
Ohio State University - Columbus			
2018 Endowment		5,211,434	Estimate at least 97% is main campus.
2018 Giving		436,974	Estimate at least 97% is main campus.
Oklahoma State University - Stillwater			
2018 Endowment	962,861	642,900	Substituted data from published documents. Revised 2008-2017-2008 using institution's published report.
Pennsylvania State University - Hershey Medical Center			
2018 Endowment	4,282,794	550,797	Substituted data from published documents.
2017 Federal Research	528,181	51,070	Estimate 9.7% based on university documents.
2018 Giving	277,661	53,311	Estimate 19.2% based on university documents.
2017 Postdocs	399	82	Estimate 20.6% based on postdoc disciplines.
2017 Total Research	826,683	100,851	Estimate 12.2% based on university documents.
Pennsylvania State University - University Park			
2018 Endowment	4,282,794	2,340,887	Substituted data from published documents.
2017 Federal Research	528,181	477,111	Estimate 90.3% based on university documents.
2018 Giving	277,661	205,747	Estimate 74.1% based on university documents.
2017 Postdocs	399	317	Estimate 79.4% based on postdoc disciplines.
2017 Total Research	826,683	725,832	Estimate 87.8% based on university documents.
Purdue University - West Lafayette			
2018 Endowment		2,523,770	Estimate at least 97% is main campus.
2018 Giving		192,303	Estimate at least 97% is main campus.
Rockefeller University			
2017 Endowment	2,049,344	2,049,395	Revised 2017 NACUBO.
2018 Giving		70,811	Substituted 2018 IPEDS.
Rush University			
2018 Giving		16,534	Substituted 2018 IPEDS.
Rutgers University - New Brunswick			
Endowment	1,330,011	1,094,224	Estimate 82.3% based on 2018 IPEDS.
Giving	184,366	159,477	Estimate 86.5% based on university documents.
2018 National Academy		35	Includes 1 reported under UMDNJ.
2017 Postdocs		306	Includes 98 reported under UMDNJ.

Data Notes for Universities with Over \$40 Million in Federal Research

University / Statistics	Original Data (dollars in thousands)	MUP Data (dollars in thousands)	Comments
State University of New York - Polytechnic Institute			
2018 Endowment		6,954	Substituted 2018 VSE.
Texas A&M University - College Station			
2018 Endowment	13,524,947	12,792,244	Substituted 2018 VSE.
Thomas Jefferson University			
2018 Endowment		264,065	Substituted 2018 VSE.
University at Buffalo			
2014 National Merit	0	2	Revised 2014 credit to wrong institution.
University of Alabama - Birmingham			
2018 Endowment	1,451,750	504,530	Substituted 2018 VSE.
University of Alabama - Huntsville			
2018 Endowment	1,451,750	78,545	Substituted 2018 VSE.
University of Alaska - Fairbanks			
2018 Endowment	339,137	211,456	Estimate 62.4% based on 2018 IPEDS.
2018 Giving		35,317	Estimate at least 97% is main campus.
University of Arkansas - Fayetteville			
2018 Endowment		1,185,715	Substituted 2018 VSE. Did not report to NACUBO.
University of Arkansas for Medical Sciences			
2018 Endowment		37,553	Substituted 2018 IPEDS. Did not report to NACUBO or VSE.
2018 Giving		19,908	Substituted 2018 IPEDS.
University of California - Berkeley			
2018 SAT		1425	Substituted SAT data from institution's Common Data Set.
2018 Endowment	1,944,306	4,730,836	Substituted 2018 VSE.
University of California - Davis			
2018 Endowment	442,615	1,416,342	Substituted 2018 VSE.
University of California - Los Angeles			
2018 Endowment	2,522,638	4,608,029	Substituted 2018 VSE.
University of California - Riverside			
2018 Endowment		250,220	Substituted 2018 VSE. Did not report to NACUBO.
University of California - San Diego			
2018 Endowment	738,174	1,625,687	Substituted 2018 VSE.
University of California - San Francisco			
2018 Endowment	1,664,471	3,212,862	Substituted 2018 VSE.

Data Notes for Universities with Over \$40 Million in Federal Research			
University / Statistics	Original Data (dollars in thousands)	MUP Data (dollars in thousands)	Comments
University of California - Santa Cruz			
2018 Endowment	104,478	203,032	Substituted 2018 VSE.
University of Cincinnati - Cincinnati			
2017 Endowment	1,282,743	1,282,824	Revised 2017 NACUBO.
2018 Endowment		1,367,000	Estimate at least 97% is main campus.
University of Colorado - Boulder			
2018 Endowment	1,220,204	655,576	Data provided by University of Colorado System.
2018 Giving	315,441	148,257	Estimate 47% based on university documents.
University of Colorado - Denver/Anschutz Medical			
2018 Endowment	1,220,204	564,690	Data provided by University of Colorado System.
2018 Giving	315,441	167,184	Estimate 53% based on university documents.
University of Connecticut - Health Center			
2017 Doctorates	342	26	Estimate based on university factbook and IPEDS Completions.
2018 Endowment	447,217	113,146	Estimate 25.3% based on published documents.
2017 Federal Research	141,977	42,093	Estimate 29.6% based on university documents.
2018 Giving	54,923	5,218	Estimate 9.5% based on university documents.
2017 Postdocs	220	122	Estimate 55.5% based on postdoc disciplines.
2017 Total Research	257,176	76,247	Estimate 29.6% based on university documents.
University of Connecticut - Storrs			
2017 Doctorates	342	316	Estimate based on university factbook and IPEDS Completions.
2018 Endowment	447,217	334,071	Estimate 74.7% based on published documents.
2017 Federal Research	141,977	99,884	Estimate 70.4% based on university documents.
2018 Giving	54,923	49,705	Estimate 90.5% based on university documents.
2017 Postdocs	220	98	Estimate 44.5% based on postdoc disciplines.
2017 Total Research	257,176	180,929	Estimate 70.4% based on university documents.
University of Dayton			
2017 Endowment	524,186	525,221	Revised 2017 NACUBO.
2018 Giving		34,768	Substituted 2018 IPEDS.
University of Hawaii - Manoa			
2018 Endowment		321,040	Estimate at least 97% is main campus.
University of Houston - University Park			
2018 Endowment	915,917	641,843	Substituted 2018 VSE.

Data Notes for Universities with Over \$40 Million in Federal Research
